The new organization christened itself the City Managers' Association. It decided that anyone may be eligible to membership who is the executive head of a municipality, provided he holds that position by appointment of the legislative body of the city. All City Managers present at the Springfield convention and all who responded to the invitation to be present, even though unable to attend, were declared to be charter members—or 13 of the 20 or so City Managers known to have been appointed thus far. The majority of the Managers, it is interesting to note, are civil engineers.*

Officers for 1914-15 were elected as follows: President, Chas. E. Ashburner, Springfield, Ohio, Vice-President, M. H. Hardin, Amarillo, Tex.; Secretary and Treasurer, Ossian A. Carr, Cadillac, Mich.

Dayton, Ohio, was selected as the meeting place for the 1915 convention.

THE TRAINING OF THE CITY MANAGER—The first place on the formal program was given to Henry M. Waite, City Manager of Dayton, Ohio, the largest city which has yet adopted the plan. Mr. Waite said the City Manager plan is the application of business methods to the operation of a city. Although in many cities engineering problems are the most important; yet the City Manager need not be an engineer.

Summing up briefly, the necessary qualification of the City Manager, Mr. Waite said:

> A City Manager should have at least a fair education, with sufficient theory, but not so much as to overbalance practicability.
> He must be an executive.
> He must know how to handle men.
> He must be fair and just.
> He must be firm but polite.
> He must have the courage of his convictions.

Young men desiring to fit themselves to be City Managers should first go into service in their own community. "An ambitious young man, with eyes and ears open, can learn more in a misgoverned city than in a well governed city."

Mr. Waite advised that City Managers who are trying to build up an efficient staff should take the honest, intelligent men already in their employ, who are "anxious to get ahead but who have been hampered by the old order of things, back them up and weed out the weak men."

CITIZENSHIP COÖPERATION—The first City Manager in any city, said Ossian A. Carr, City Manager of Cadillac, Mich., has so much pioneer work to do in bringing order out of chaos that he has particular need of coöperation from the public. This he can get through civic associations and public-spirited individuals. The old-fashioned town meeting may also be of great assistance through the opportunity it affords for discussion and education.

HANDLING PUBLIC-SERVICE CORPORATIONS AND CONTRACTORS—A spirit of fair play and justice to both sides should be observed in dealing with both public-utility companies and contractors for improvements, argued Claude E. Chappell, City Manager of Big Rapids, Mich.

The feeling on the part of the public that lighting and other franchise companies are making exorbitant profits can be met and the companies at the same time be encouraged to reduce rates by a profit-sharing scheme which permits increases in dividends whenever the service rates are lowered.

---

*See "Engineering News," July 8, 1909, for an account of the inception and early history of this plan at Staunton.

*The following is a tentative list of cities which had adopted the City Manager plan up to Dec. 1, 1915, with the names of the Managers, so far as yet appointed and known, and with the names of charter members indicated by an asterisk and the names of those in attendance shown by a dagger:

Niagara Falls, N. Y.; Titusville, Penn., H. A. Holstein; Staunton, Va., S. D. Holsinger; Hickory, N. C., * S. C. Cornwell; Sumter, S. C.; Lakeland, Fla., *D. F. McLeod; Dayton, Ohio, *†Henry M. Waite; Springfield, Ohio, *†Charles E. Ashburner; Big Rapids, Mich., *†Claude E. Chappell; Cadillac, Mich., *†Ossian A. Carr; Jackson, Mich.; Manistee, Mich., *†Charles E. Ruder; Marquette, Mich.; Traverse City, Mich.; River Forest, Ill., *†Karl M. Mitchell; Morris, Minn., *S. A. Siberts, Jr.; Abilene, Kan., *†Kenyon Riddle; Amarillo, Tex., *†M. H. Hardin, Benton, Tex.; Montrose, Colo., *F. W. Pinkerton, Phœnix, Ariz., W. A. Farish; La Grande, Ore., *F. J. Lafky; Inglewood, Calif., Paul E. Kressly.

As to dealing with contractors, Mr. Chappell first called attention to the fact that specifications are so drawn that contractors bid "not upon furnishing a definite amount of labor and material, but upon the temper of the engineer." Then, too, the contractor is "frequently called upon to assume responsibility for both design and construction, although the former may be entirely beyond his control."

Summing up this part of his paper, Mr. Chappell said:

It has been my observation that a contractor is about as honest as the supervision under which he works. If the engineers and inspectors are the soul of honor, the contractor can "put one over on them" only through their ignorance. If they are both honest and competent, they make the rules and he plays the game accordingly.

Much instruction and amusement were afforded by the experiences related by M. H. Hardin, City Manager of Amarillo, a small city on the plains of Texas. Mr. Hardin had been a district-court clerk for twenty years when he was unexpectedly asked to become City Manager of Amarillo. Among other achievements, he has cleaned up the milk supply and collected a large percentage of delinquent taxes. Asked how many commissioners govern Amarillo, Mr. Hardin said: "There are three. It may be that you bigger men can herd more, but it is all I can do to keep three commissioners going in the right direction."

NEWS NOTES

A Fire at Ardsley-on-Hudson, N. Y., on Dec. 6, cost the lives of four persons and destroyed property valued at about $[illegible]. The fire started in a barber shop.

Nantucket Shoals Lightship Adrift—Lightship No. 65 on Nantucket shoals went adrift when her anchor chains parted under the stress of a northeast gale on Dec. 6. The revenue cutter "Acushnet" left Woods Hole, R. I., to lend assistance [illegible] the coast and all steamers were kept informed of the vessel's position by messages sent at frequent intervals by her wireless operators.

Water Flowed Over the Crest of the Scioto River Dam of the waterworks of Columbus, Ohio, on Dec. 6 for the first time since [illegible]. This broke the next to the longest dry spell since the dam was completed, the longest one extending from [illegible] to Feb. 15, six or seven years ago. Notwithstanding the heavy rain during the week ending Dec. 5 the rainfall thus far in 1914 totaled only 29.80 in. up to that date as compared with a normal of 31.61 in.

Ocean Storm Damages New Jersey Coast—A northeast storm accompanied by high tides wrecked shore bulkheads, [illegible] ... resorts on the New Jersey coast on Dec. 4-5. At Atlantic City a pier was damaged. At [illegible] large sections of beach were washed out. The roadbed of the Central R.R. of New Jersey between [illegible] and Highland Beach was damaged. The wind velocity at Atlantic City was about [illegible] mi. per hr. At [illegible] a tide of [illegible] ft. was recorded at noon on [illegible] [illegible] It is claimed that tides as high [illegible] in 18[illegible]. The long [illegible] was damaged. [illegible]

The San Francisco Refuse Incinerator [illegible]

Coordination of the Various Street Bureaus [illegible] revision with that end in view. The present Bureau of Highways has no jurisdiction over the work of the Department of Water Supply, Gas and Electricity, the Public Service Commission, and other departments and bureaus, which are continually opening the pavements for one reason or another.

November Progress of Rogers Pass Tunnel—The following is the record of heading progress on the Rogers Pass Tunnel of the Canadian Pacific Ry. for November:

East end, center heading, 555 ft	Schist with some quartzite.
East end, pioneer heading, 529 ft	Quartzite with some schist
West end, pioneer heading, 817 ft	Slate with small quartzite bands
West end, center heading, 654 ft	Slate with small quartzite bands

The west end pioneer heading footage is believed to be the American record of rock-tunnel progress. This heading was driven down grade through rock that could not be broken over 6 ft. per round. The best day's progress was 37 ft. Joseph Murphy is Assistant Superintendent at the east end, and Joseph Fowler is Assistant Superintendent at the west end. A. C. Dennis, Superintendent, Foley Bros., Welch & Stewart, contractors.

Grade-Crossing Elimination at Columbus, Ohio—Plans were approved on Dec. 4 for grade-crossing elimination on two miles of the line of the Norfolk & Western R.R., mostly within the city of Columbus. The work calls for 700,000 cu.yd. of embankments and the carrying of ten streets beneath the tracks, and is estimated to cost about $1,000,000. The ten streets will be spanned by steel structures on concrete piers. Under a state law, the railroad company will do all the work except paving the subgrade streets. The city will bear 35% of the cost of two-track work, but the company expects to provide for four tracks. J. E. Crawford, Roanoke, Va., is Chief Engineer of the Norfolk & Western, and Henry Maetzel is City Civil Engineer of Columbus. Grade crossings at Columbus have already been eliminated by the Baltimore & Southwestern, Hocking Valley, Toledo & Ohio Central, and the Little Miami Division of the Pennsylvania Lines. The city's share of the work already done has been about $1,000,000. There remain the grade crossings on the Big Four, plans for which may come along in 1915.

Electric Propulsion will be used for the battleship "California," contracts having been given by the U. S. Navy Department to the General Electric Co. for the installation of a complete drive similar to that which has proved successful on the collier "Jupiter." (See "Engineering News," Sept. 12, 1912.) It is reported that the guaranteed speed is 21 knots and the contract price $450,000. While details are not available, it is probable that there will be two high-speed steam-turbine alternating-current generating units and four induction motors, one on each propeller shaft. Presumably there will be two engine rooms, but then all four motors will be run from one turbine unit except at high speeds (above 15 to 19 knots). A new type of motor has been developed for this service, no starting or backing resistance being required as on the "Jupiter." This motor has a double squirrel-cage rotor, the outer layer of conductors having high resistance and the inner layer having low resistance. In starting or backing, the inner one takes very little current while the outer one gives high torque. Toward full speed, the inner cage comes more into action and ordinary induction-motor conditions prevail. The stators would have pole-changing windings to secure a further possible speed reduction between turbines and screws.

Contract Prices for Brick and Concrete Roads in Illinois—Contracts have been awarded during the current year for 74 sections of roads having a total length of 481,[illegible] ft., or 91.27 mi., of which 56 sections with a total length of 388,369 ft. or 73.56 mi. have been concrete and 18 sections with a total length of 93,[illegible]19 ft. or 17.71 mi. have been brick. Almost [illegible] mi. of 10-ft. concrete roads have been contracted for at an average total price of $11,[illegible] per mi., or $[illegible] for the pavement proper, which is at the rate of $1.[illegible] per sq.yd. The minimum was $[illegible], and the maximum $[illegible] per mi., or $1.01 and $1.[illegible] per sq.yd., respectively. The total price for the 10-ft. concrete roads has been $[illegible] or $[illegible] per mi. for the pavement proper, which is a little more expensive than the 10-ft. brick roads which average $12,610 for a total cost, or $11,[illegible] for the pavement alone. The average price for the whole 91.27 mi. (brick and concrete) is $[illegible] per mi., of which $[illegible] is for the pavement proper. The unit price for [illegible] ft. macadam shoulders which average [illegible] in. in thickness is $1930 per mi. In nearly all cases where a long stretch of road is contracted for the unit cost per mile is considerably smaller than where a short piece of road is built. This is due, in part, to the fact that the contractor can organize his force better on large work, which permits him to do better

and cheaper work, and, furthermore, he is willing to make a smaller percentage of profit on a large contract than on a small one.—K. N. Evans, Junior Engineer, Illinois State Highway Commission, in "Illinois Highways," November, 1914.

A Program for Earth-Road Maintenance is given by Frank S. Cook, Superintendent of Highways of Tazewell County, Ill., in the November issue of "Illinois Highways," as follows: "In the spring, as soon as the ground has settled sufficiently to get on the roads with a tractor, clean out the side ditches, using a 6- or 8-ft. grader and going two or three rounds, as may be necessary. Then follow up with the leveler, pulling the loose dirt into the hollow places and giving the road the proper crown. When this is done, I believe the heavy machinery should be put in a shed and left there. Road drags, under ordinary weather conditions, if timely used, will keep the road in good shape until winter, and even then they can be used to advantage. Getting the drags used systematically will be the hardest part of the work. The commissioners should make arrangements with the farmers along a certain road to drag at the same time when called up by the commissioner or by someone appointed to do so. Of course, the entire length of the road in the township should be dragged, for if parts of it are not, then some of the benefits of the dragging that is done will be lost. The work should be done after rains. If the road is not badly rutted, the dragging need not be done until the ground is partially dried out, but if the surface is uneven, then the work should be done while the ground is still wet so as to fill up the hollow places. Each one doing any dragging should be provided with blanks to be filled in and mailed to the commissioner immediately after doing the work. These slips should state the time, section of road, price per mile and the amount due for dragging on that date."

The Opening of the Magnolia Cutoff Line of the Baltimore & Ohio R.R. between Orleans Road and Little Cacapon, W. Va., a distance of 12 miles, on Dec. 6, marked the completion of the largest improvement of the kind ever undertaken. The line cost $6,000,000, or $500,000 per mile. The purpose of the new cutoff is to relieve the traffic congestion on the main line east of Cumberland, caused by the fact that two main lines from the West connect at this point. A third and fourth track were added to the main line, under a plan which eventually will provide a four-track railway to the seaboard at Baltimore. The cutoff is nearly straight and level, saves six miles in distance and 887° of curvature. The work entailed the excavation of 3,500,000 cu.yd. of rock and earth; building four double-track tunnels with a combined length of 7100 ft., erecting 25,000 cu.yd. of concrete bridgework, 50,000 cu.yd. of concrete retaining and inter-track walls, and removing 1,500,000 cu.yd. of material for a four-track cut 200 ft. deep, which takes the place of Doe Gulley Tunnel, where the four parallel tracks reach their highest elevation. Only 3000 tons of steelwork were used on the entire improvement. With the beginning of work 18 months ago, nearly 10,000 workmen and their families moved into the vicinity, locating chiefly in Paw Paw. A modern town was laid out by the railroad. The work was under the direction of Francis Lee Stewart, Chief Engineer, and John T. Wilson, District Engineer, of the B. & O. R.R. The contract was let in seven sections to as many contractors. The completion of the Magnolia Cutoff is the last item of a list of improvements involving the reduction of grades, elimination of curves, removal of tunnels, and purchase of new equipment, costing a total of $100,000,000.

PERSONALS

Mr. John Mitchell, City Manager of Hickory, N. C., has resigned and will reënter the practice of law at Walla Walla, Wash.

Naval Constructor David W. Taylor, U. S. N., has been appointed Chief of the Bureau of Construction and Repair of the United States Navy, succeeding the present Chief, Richard M. Watt, who retires Dec. 10.

Mr. Lazarus White, M. Am. Soc. C. E., recently Division Engineer of the Catskill Aqueduct, Board of Water Supply, New York City, is now Managing Engineer of Smith, Hauser & MacIsaac, Inc., Contractors, New York City.

Mr. William F. Robertson, City Manager of Sumter, S. C., resigned on Dec. 1 to become Secretary of the Chamber of Commerce of Greensboro, N. C. Sumter was temporarily without funds for improvements and Mr. Robertson, who is an engineer, wished a more active position.

Mr. W. F. Graves, Assoc. M. Am. Soc. C. E., Chief Engineer of the Montreal Tramways Co., has been selected as one of a committee of three to make a valuation of the track property of the Detroit United Rys. Co., for the Michigan Railroad Commission. He was formerly with the engineering staffs of the elevated and surface street railways of Chicago.

Mr. Byron T. Burt, F. Am. Inst. E. E., General Manager and Electrical Engineer of the Chattanooga & Tennessee River Power Co., Chattanooga, Tenn., has resigned to become Manager of the South American Trading Co., Buenos Aires, Argentina, which has recently entered the South American field for the sale of American manufactures. He is succeeded as General Manager of the Chattanooga & Tennessee River Power Co. by Mr. George S. Baker, former Auditor.

Mr. Sydney B. Williamson, M. Am. Soc. C. E., of J. G. White & Co., Ltd., London, England, has been appointed Chief of Construction of the United States Reclamation Service, a newly created office. Mr. Williamson is the well known Division Engineer of the Pacific division of the Panama Canal. Since the completion of Panama Canal he has been with J. G. White & Co., of London. He will spend the greater part of his time in the field, his particular function being to expedite construction work, and to secure the greatest possible efficiency.

Mr. Nicholas S. Hill, Jr., Consulting Engineer, New York City, announces that he has formed a partnership with Mr. Smith Farley Ferguson, former President of Mackenzie, Quarrier & Ferguson, Inc., Contracting and Construction Engineers, New York City, under the firm name of Nicholas S. Hill, Jr., & S. F. Ferguson, and with offices at 100 William St. Mr. Hill will continue as a consulting hydraulic and sanitary engineer, devoting his time entirely to work of a technical nature, while Mr. Ferguson will take charge of the office management and construction work.

Dr. John Edson Sweet, Past-President of the American Society of Mechanical Engineers, was awarded the John Fritz Medal of the national engineering societies at the annual meeting of the American Society of Mechanical Engineers, Dec. 2, for his work in the invention and development of the "straight-line" engine. He was born in 1832. His first work was as an apprentice to the carpenters' trade, and previous to the Civil War was engaged in building work in the South. Later he spent two years as a mechanical draftsman and student in England and Europe. In 1873 he was appointed Professor of practical mechanics at Cornell University, where he remained until 1879, when the Straight Line Engine Co. was formed.

Mr. Howard Whitney, a civil engineer of Nashua, N. H., has been appointed Engineer of Maintenance-of-way of the Springfield (Mass.) Street Ry. Co., to succeed Mr. H. M. Flanders, promoted as noted in our issue of last week. Mr. Whitney will have entire charge of the maintenance of track, bridges and structures of the street-railway systems owned or controlled by the New England Security & Investment Co., of which the Springfield Street Ry. is one. Mr. Whitney is a graduate of Tufts College, and his first engineering experience was with the Missouri Pacific Ry. Later he was Resident Engineer of the Grand Trunk Ry. at Woonsocket, R. I., and with the maintenance-of-way department of the Boston & Maine R.R.

Mr. F. H. Newell, M. Am. Soc. C. E., Director of the United States Reclamation Service, has been appointed Consulting Engineer of the Service, and the offices of Director and Chief Engineer have been consolidated, Mr. A. P. Davis, M. Am. Soc. C. E., the present Chief Engineer, becoming Director and Chief Engineer, as noted elsewhere. Mr. Newell is a native of Pennsylvania and a graduate of the Massachusetts Institute of Technology, class of 1885. He was engaged in the hydraulic work of the U. S. Geological Survey in 1888, and for 12 years, 1890 to 1902 was Hydrographer of the Survey. He was Chief Engineer of the Reclamation Service from its foundation in 1902 to 1907, when he was appointed Director.

Mr. Arthur P. Davis, M. Am. Soc. C. E., Chief Engineer of the United States Reclamation Service, has been made Director also, succeeding Mr. F. A. Newell, M. Am. Soc. C. E., who becomes Consulting Engineer, as noted elsewhere. Mr. Davis was born in Illinois in 1861 and graduated from the State Normal School at Emporia, Kan., and Columbian (now George Washington) University, Washington, D. C., in 1888, having won his degree while serving as a topographer in the U. S. Geological Survey. From 1895 to 1897 he was Hydrographer in charge of all government stream measurements, and from 1898 to 1901 Hydrographer of Isthmian Canal Commission, in chargo of hydrographic surveys both at Panama and Nicaragua. He succeeded Mr. Newell as Chief Engineer of the Reclamation Service in 1907. Mr. Davis has also served as Consulting Engineer for the Isthmian Canal Commission, the Russian Government and for large irrigation projects in the American colonies.

OBITUARY

[illegible], a civil engineer of Tokyo, Japan, died Oct. 3[illegible].

[illegible], a [illegible] engineer of Duluth, Minn., died Nov. [illegible] while on a hunting trip in northern Minnesota. He was born in [illegible] and had lived in Duluth since 1886. From 188[illegible] to 1892 he was Manager of the National Iron Works.

[illegible] Christy, M. Am. Inst. M. E., Dean of the College of Mining of the University of California, a well known metallurgist, died Nov. 3[illegible] at his home in Oakland, Calif. He was 6[illegible] years old. He was a native of California and a graduate of the College of Mining of the University of California, class of 187[illegible]. He soon joined the faculty, and in 1879 was made [illegible]. He was known as an author, and was a member of [illegible] societies.

[illegible] Tuttle, former President of the Boston & Maine R.R., died at his home in Brookline, Mass., Nov. 30. He was born in Hartford, Conn., in 1846, and after a public-school education began his railway career as a ticket clerk on the Hartford, Providence & Fishkill R.R. Thereafter he was connected with the passenger departments of various early New England railroads until 1889, when he was made Commissioner of the Trunk Line Association. Subsequently he was General Manager of the New York, New Haven & Hartford R.R., and from 1893 to 1910, President of the Boston & Maine R.R., and its subsidiary, the Maine Central R.R.

Owen J. Travis, former Superintendent of Bridges and Buildings of the Colorado & Southern R.R. and the Fort Worth & Denver City Ry., died Nov. 11 at Everett, Wash., aged 66 years. His bridge-building experience began in 1868 with the Keystone Bridge Co. on the construction of a bridge in Kansas City, Mo. For several years he was Superintendent of [illegible] of the St. Louis Bridge Co., and later Superintendent of Bridges and Buildings of the Middle division of the Wabash, St. Louis & Pacific R.R. He served in the same capacity with the Iowa Central R.R., the Elgin, Joliet & Eastern R.R., the [illegible] Central R.R. and the Colorado & Southern R.R.

[illegible], Superintendent of the Arizona Eastern R.R., [illegible], Ariz., died at New Orleans, La., Nov. 21. He was born in [illegible] in 186[illegible] and received his education at Stewart College, Tennessee. His first engineering experience was with the [illegible] of Morgan's Louisiana & Texas R.R. Later he was Assistant Engineer of the Sabine & East Texas R.R. and the Houston & Texas Central R.R., and Engineer [illegible] on the [illegible] Texas & Mexican Ry. He returned to Morgan's Louisiana & Texas R.R. as Roadmaster and Assistant [illegible], and was promoted to be Assistant Superintendent of [illegible] of the Atlantic System of the Southern Pacific Co. From 188[illegible] to 189[illegible] he was [illegible] and Assistant Superintendent of the Louisiana lines of the company. From 1[illegible] to 1906 he was Assistant [illegible] of the Gila Valley, Globe & [illegible] Ry., and [illegible] of this road and its [illegible], the Arizona Eastern R.R.

ENGINEERING SOCIETIES

COMING MEETINGS

[illegible]

Brooklyn Engineers' Club—The annual meeting of the Brooklyn Engineers' Club will be held at 117 Remsen St. on the evening of Dec. 10. The nominations for officers for the coming year are as follows: President, J. S. Langthorn; Vice-President, G. Laurence Knight; Secretary, Joseph Strachan; Treasurer, William W. Brush; Directors, Carleton A. Graves and Percy C. Barney. The annual dinner will be held at the Club on Dec. 17.

Engineers' Society of Pennsylvania—The following candidates have been nominated for office during the year 1915: President, Farley Gannett, Engineer Water-Supply Commission of Pennsylvania, Harrisburg; First Vice-President, Charles H. Mercer, Chief Engineer of Bridge and Construction Department, Pennsylvania Steel Co., Harrisburg; Secretary, Edward R. Dasher, Harrisburg; Treasurer, R. Boone Abbott, Division Engineer, Philadelphia & Reading Ry. Co., Harrisburg. The election will be held at the headquarters of the Society in Harrisburg on Friday evening, Dec. 11, 1914.

Engineers' Club of Philadelphia—The "Bulletin" of the Club for November announces a plan for the unification of all the engineering societies of Philadelphia, with the Engineers' Club as a nucleus. The Executive Committee proposes to change the name of the organization to the Engineers' Society of Philadelphia, and to establish four classes of members: active, junior, honorary and affiliated. The last class would include all members belonging to affiliated societies. All these societies would have the advantage of the use of the present house of the Engineers' Club, and their members would be eligible for active membership in the Club.

Granite Paving Block Manufacturers' Association of the United States—A number of Eastern granite paving block manufacturers met in Boston, Dec. 3, and organized for the following purpose:

"Whereas, It is desirable that the high value of granite paving blocks for use in the building and constructing of streets and roadways be made known to the general public, and that the manufacture of the same be made to conform to a high and proper standard, and that the use of the same be adapted to other purposes, all to the end that the manufacture and use of said granite paving blocks may be stimulated and increased for the mutual benefit of the public and manufacturers of said blocks, therefore, the subscribers hereto form an association to be known by the name and style of "Granite Paving Block Manufacturers' Association of the United States," in order to promote the welfare of its membership in such manner as this constitution and these by-laws provide."

The following board of directors was unanimously elected: C. Harry Rogers, of the Rockport Granite Co., of Boston, Mass., President; Joseph Leopold, of J. Leopold & Co., Inc., of New York, Vice-President; James Adamson, of Booth Bros. & Hurricane Isle Granite Co., of New York, Secretary; Thomas Lahey, of the Hildreth Granite Co., of Boston, Mass., Treasurer.

New York Section of the American Water Works Association—The third meeting of this local branch of the society was held in the banquet room of the Manhattan Hotel Dec. 3. After the usual luncheon two papers were read. The first, by W. W. Brush, Deputy Chief Engineer of the Department of Water Supply, Gas and Electricity, New York City, described the work, equipment and organization of the maintenance division of the department. The paper was interesting and [illegible] and was illustrated by many lantern slides. The distribution system was described from the point where the water leaves the city reservoirs or the new tunnel of the Catskill aqueduct to the street [illegible], many of which are in very complicated situations, due to the multitude of other subsurface structures. Various yards and equipment were illustrated [illegible] [illegible] [illegible]. The division of the city into repair zones and the organization of the force of about 7[illegible] employees into maintenance and repair [illegible] was of interest [illegible] from the [illegible] of the work to be done. The [illegible] of [illegible] as many [illegible] of valves as possible [illegible] for leaks [illegible] were outlined, but these and many more details are to be given in a more formal paper to be presented later to the parent society. The second paper by [illegible], City Engineer of Yonkers, N. Y., gave a history and [illegible] of the Yonkers water-supply, and the proposed development to [illegible]. The position of Yonkers is interesting because, like other small cities [illegible] the [illegible] to be suburbs of great cities like New York, all the really economical water-supply resources have been [illegible] for metropolitan use. Hence Yonkers is practically shut out from a new supply and is obliged to further develop its present sources to their fullest capacities.

VOLUME 72 DECEMBER 17, 1914 NUMBER 25

Plant Tests of a Low-Head Hydro-Electric Development

By F. Nagler*

The Centralia Pulp & Water Power Co., of Grand Rapids, Wis., has recently placed in operation, on the Wisconsin River, a low-head hydro-electric development for supplying power to the Nekoosa-Edwards Paper Co.'s mills at Port Edwards and Nekoosa, Wis., which were among the first to abandon complicated line-shaft transmission and use simple and direct motor drives.

At the outset it was recognized that the single-runner vertical-shaft turbine was most favorable to high efficiency and to simplicity of station arrangement. Recent improvements in high-speed runners have been very marked and it was found that the cost of single-runner, direct-connected units of suitable size would not be materially different from that of multiple-runner machines at higher speeds. Further, it was found that the power house would be less expensive by reason of its greater simplicity, and this feature, combined with the higher efficiency, decided the type of the installation.

On account of its being the first plant of its kind using high-capacity runners for a low head, very exacting guarantees of power and efficiency were required, with the understanding that carefully conducted tests would be made. It is the writer's purpose to describe briefly the general layout of the plant, but more particularly to outline the power, efficiency and speed-regulation tests at the plant.

Fig. 1. Generating Room, Grand Rapids Station of Centralia Pulp & Water Power Co.

Generating Station

The appearance of the generator room is seen from Fig. 1. Fig. 2 gives a cross-sectional view through one of the main turbine pits. Simplicity is the keynote of the entire plant. The headgate arrangement in particular is extremely plain but ingenious, and has proved very satisfactory in actual operation. The headgate slots are in the main generator room. Each turbine pit has a center column as the span is too great for a single gate. Two gates of structural steel are provided and are ordinarily kept in a slot at the end of the power house. They are provided with eye-bolts and lifting hooks so that they

*Hydraulic Engineer, Allis-Chalmers Co., Milwaukee, Wis.

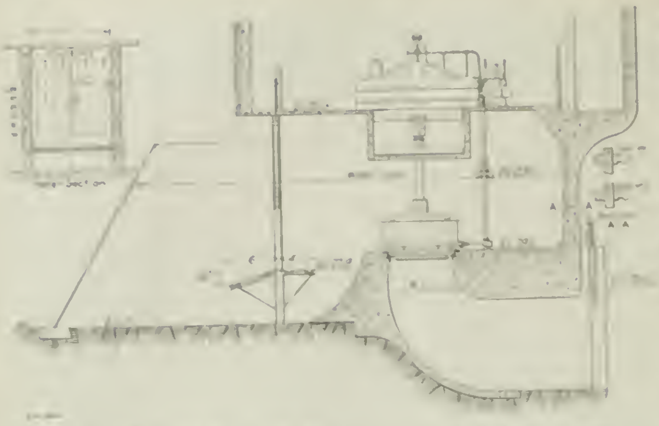

FIG. 2. CROSS-SECTION THROUGH A MAIN UNIT, SHOWING TEST ARRANGEMENTS

can be easily handled by the station crane. Wooden sills are provided at the bottom so as to insure practically a water-tight fit. For most extreme conditions, a few shovel-fuls of cinders serve to make the gate so tight that a 6-in. [illegible] drain will carry away all leakage. This drain is placed along the sloping face of the concrete immediately upstream from the turbine proper, so that the pit floor around the turbine is absolutely dry. One of the main gates is provided with a filler gate so as to prevent the necessity of lifting the gates against full operating pressure. Besides the trash rack at the station, there is additional protection against floating material, particularly ice, by a concrete guard structure at the forebay entrance adjacent to the dam. An apron extends some feet below water surface, and between supporting piers is a special trash rack with bars on [illegible] centers.

The plant comprises four [illegible] r.p.m. hydro-electric units designed for a normal head of 13 ft. Two [illegible] exciter units are provided, one turbine driven and the other motor driven. Power is transformed from [illegible] volts to [illegible] by three [illegible] single-phase oil-filled water-cooled transformers, one spare is provided. The energy is transmitted about [illegible] miles to the paper mills in Nekoosa and Port Edwards [illegible].

Main Units—The main units are of the three-bearing type, with the thrust bearing located on top of the generating housing so that the main shaft is [illegible] in tension. This places the most important working parts on a single operating floor [illegible] a light concrete floor underneath the generator [illegible] below the rotor and around the [illegible] from which the [illegible] and oil pumps are driven. [illegible] through this connecting floor, which runs the entire length of the building, [illegible] in the separate [illegible]. The weight of each generator frame and rotating part of the unit is carried on concrete and steel beams which span the turbine pit. The entire unit, including turbine, generator and governor, was designed together to [illegible] parts, to [illegible] from all [illegible] and, in particular, very close speed regulation.

Not only the runner but also the entire guide case and [illegible] of the same design as the [illegible] model. The runner (Fig. 3) is constructed of plate steel vanes cast-welded to a cast-iron crown plate and discharge ring. The runner has a nominal diameter of 68 in., the outside diameter being about 8 ft. The main turbine guide bearing is located on the cover plate immediately above the runner, and is of the water-lubricated lignum-vitæ type with adjustable bearing blocks. The cover plate itself is rigidly connected to the walls of the pit by cast-iron columns in order to insure absolute alignment.

As is common in low-head plants of this kind, the desirable limits of excavation practically fixed the form of the draft tube. This was built of gradually increasing sections, the exit velocity being under 3 ft. per sec.* The exciter turbine is provided with a straight, tapered draft tube of plate steel, as the turbine is of such size (28-in. runner) that a prohibitive amount of excavation was not required.

The generators are designed with a heavy upper housing, which contains the upper steady bearing and supports the main thrust bearing. The collector rings are located on a shaft extension above the thrust bearing, the leads to the rotating field being carried down through the shaft (bored out) to the rotor. The rotor itself has a very heavy rim in order to assist in securing the close speed regulation required for a paper-mill supply.

FIG. 3. LOW-HEAD HIGH-SPEED RUNNER AT GRAND RAPIDS TURBINE

The thrust bearings are of the plane-disc type, the rotating surfaces operating submerged in a bath of oil. They are [illegible] and the rotating [illegible]

*[illegible]

produces a continuous circulation of oil. Water-cooling coils are placed within the housing. The bearings run at a temperature very slightly above room temperature.

The governors are of the oil-pressure type and are direct-connected to the gate-operating mechanism without the use of any gearing. Lost motion in the mechanical connections has been reduced as far as possible. The regulating shaft is of very large diameter to reduce torsional deflection. The flyballs (inclosed) are driven from a horizontal jackshaft geared to the main shaft. A rotary oil pump (250 lb. pressure), belt driven from the same jackshaft, together with the regulating cylinder, is located in the governor housing which supports the flyballs. The receiving tank is located below this housing, while the pressure tank (plate steel) is located at some distance. Cold-drawn seamless steel tubing with rolled flanges and brass valves is used for the distribution of oil.

The main generating equipment, including turbines, governors, generators, exciter sets and transformers, was furnished by the Allis-Chalmers Manufacturing Co., the exciter governor by the Woodward Governor Co., and the switchboard by the General Electric Co.

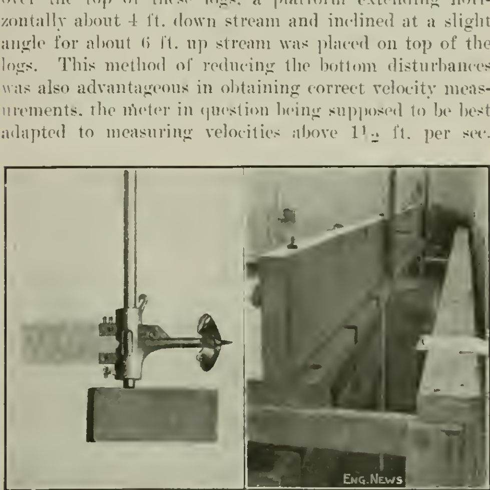
Tests

Careful tests were made to determine the capacity, efficiency and speed regulation of the machinery as installed. Furthermore, the unit was permitted to operate at full runaway speed with the turbine gates wide open and with no load on the generator. In determining capacity the output of the generator was measured by two single-phase indicating wattmeters (laboratory instruments), which were calibrated both before and after the tests. For determining efficiency it was necessary to obtain also the exact operating head and the quantity of water consumed. Speed-regulation tests were made by building up successively the various loads desired, suddenly opening the main generator switch and noting both the speed rise and the time required to resume normal speed.

The operating head was measured by special head and tail gages set and checked before the test work was performed and rechecked afterwards by means of a surveyor's level. Gage barrels were made of 1-in. iron pipes capped at their lower ends and drilled with a large number of ½-in. holes placed on a vertical line. These were wedged into the gate slots in such a position that the holes were flush with the side walls of the flume and the flow of water was tangent to them. Tin floats were used, provided with ¼-in. iron rods which extended up to a gage board. It was feared that the use of iron barrels would cause more or less trouble in midwinter work, but very little difficulty from freezing was experienced, even though the temperature was from 10 to 20° F. during most of the tests.

The quantity of water was measured immediately up stream from the turbine by determining the average velocity past a measuring section of known area. (See Fig. 2.) In determining average velocity, the flume was divided into squares approximately 2 ft. on a side, and the meter rig so arranged that the meter could be placed at the central point of each of these divisions. Depending on the depth of water, either 12 or 18 individual readings were taken for each run. The average of these readings, as determined by integrating the velocity curves, was taken as the average velocity over the cross-section.

It was originally desired to measure the velocities in the flume exactly as it is used in ordinary operation, but examination of the flow conditions by means of an indicator showed that the abrupt rise in the flume bottom immediately down stream from the only available measuring section caused a considerable disturbance and eddy currents which would introduce decided inaccuracies in the determination. On this account a tier of stop logs about 6½ ft. high was placed in the bottom of the gate slot, the top of these logs being slightly below the level of the turbine base. In order to reduce disturbances over the top of these logs, a platform extending horizontally about 4 ft. down stream and inclined at a slight angle for about 6 ft. up stream was placed on top of the logs. This method of reducing the bottom disturbances was also advantageous in obtaining correct velocity measurements, the meter in question being supposed to be best adapted to measuring velocities above 1½ ft. per sec.



Figs. 4 and 5. Current Meter and Position Frame

The only other effect of this stop-log arrangement is probably to the disadvantage of the turbine in that the higher velocities resulting from its use will probably produce more disturbance in the turbine pit, but this effect was considered to be negligible, as average velocities at all times were below 3 ft. per sec.

An accurately rated current meter of the screw type was used (an Ott instrument furnished by the Keuffel & Esser Co.) and is shown in Fig. 4. This was supported at the lower end of a 2-in. pipe which was drilled and arranged so that it could be readily shifted from one position to another, either horizontally or vertically. A plank support was provided, as shown in Fig. 5, to facilitate shifting. The arrangement was very simple, but worked out very satisfactorily in actual use, it being possible to take the 12 or 18 readings in about 35 min.

The number of revolutions were counted simultaneously by two observers. Practically all readings were over ½ min. in duration. Two telephone receivers were inserted in the meter circuit so that the observers could check one another. Alternating current was used to operate these receivers, and proved very satisfactory, as absolutely no difficulty was experienced with the contact points of the meter. It might be mentioned that the meter in question was equipped with two contact points so arranged that the buzz was divided into two parts, one short and one long. This arrangement was provided for

detecting immediately any reversal of flow in the measuring section.

The test in general was kept as simple as possible, only the [illegible] data being taken. These data, together with all the various calculated efficiency results, were tabulated and more in detail than shown in Tables I and II. The column numbers, (1), (4), (6), (7), etc., are retained as on the original sheet to show the omissions necessary here. The missing data cover (2) (3) time beginning and end of run, (5) governor dial, (14) generator horsepower, (15) to (18) generator volts, amperes, field and power factor, (20) head variation, (22) foot-pounds per second turbine input, (23) oil-pump horsepower, (25) foot-pounds per second turbine output,

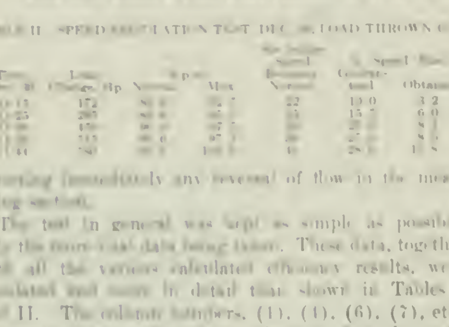

FIG. 6. [illegible]

(28) [illegible] horsepower, (29) per cent [illegible] power, (30) foot-pounds per second [illegible] output. In Table II the load [illegible] in kilowatts has been omitted and the [illegible] readings. Fig. 6 gives the important results in graphical form.

In all of this work, a careful record was kept of the actual gate opening in inches in order that a direct comparison with the Holyoke performance might be possible. [illegible] the drawing [illegible] of the Holyoke curve shown in Fig. [illegible]. It will be noted that a maximum turbine efficiency slightly in excess of 88% was obtained in the power-plant setting. While this efficiency is the highest reported to date on authentic test for a plant of this nature, the inference may be directly drawn that the power-plant setting was not quite so favorable as was the Holyoke setting on a runner of similar characteristics. The difference is undoubtedly traceable to the effect of the more favorable draft tube and to the relatively larger flume at Holyoke. For the plant efficiency overall, considering all turbine and generator losses as well as those in the thrust bearing, governor and governor drive, a maximum of 83.5 was reached. Several of the runs were at "over-gate" points. These were possible by reason of the fact that the gate stops were set back to permit of securing maximum capacity under lower than normal head. The characteristics of the runner are such that the full gate opening is not an over-gate position for heads around 10 and 11 ft., whereas it is very markedly so under heads in excess of normal such as existed during the runs in question.

In making the velocity determinations, the mean readings at the various points were plotted in curve form, these curves being made for both the horizontals and verticals. Fig. 7 shows the vertical velocity curves from which the mean horizontal curve shown at the right of Fig. 8 is drawn. Fig. 8 shows the individual horizontal velocity curves from which mean vertical curve shown at the right of Fig. 7 is drawn. The average velocity was obtained from these curves by means of a planimeter, and the two different determinations checked in all instances well within 1%.

The mean horizontal curve shown at the right of Fig. 8 [illegible] as indicating the distribution of velocities across the flume. It will be noted that the turbine is placed symmetrically in the flume and that the major portion of the water passes to the left, looking downstream. This is in direct accordance with the theory of spiral flow in a runner and affords [illegible] a direct indication that the turbine should be placed slightly to the right of the center line of the flume (looking downstream). The turbine rotates in a right-hand direction, and moving it slightly away from the center line tends to provide larger flowage [illegible] between the guide vanes and side wall where the flow is indicated as being the greatest. This point probably has very little influence on power-plant performance in an installation of this nature, but the indication is commented upon as having more or less bearing on installations of this type where higher velocities are involved.

Results of the overspeed tests are shown in the following table:

Gate Opening In.	Speed (Field Not Excited) R.p.m.	Speed (Field Excited) R.p.m.
1¾	90.0	....
2	91.5	....
3	105.0	....
4	115.0	....
5	120.0	....
6	126.0	....
7	130.0	....
7½	132.5 (147%)	130.5 (145%)

This overspeed run is of interest as indicating what may be expected in actual installations of this nature. The runaway speed of the runner in the Holyoke flume was between 65 and 70% above normal. The effect of windage and friction is very much in evidence in the reduction of this amount to approximately 50% above. Furthermore, the effect of an excited field was somewhat less than was anticipated, as it only affected the overspeed about 2%.

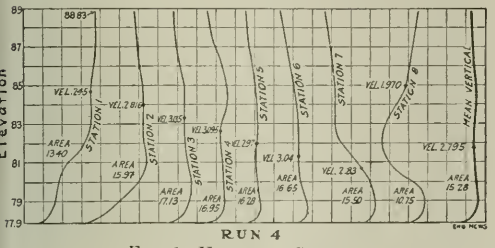

Fig. 7. Vertical Curves

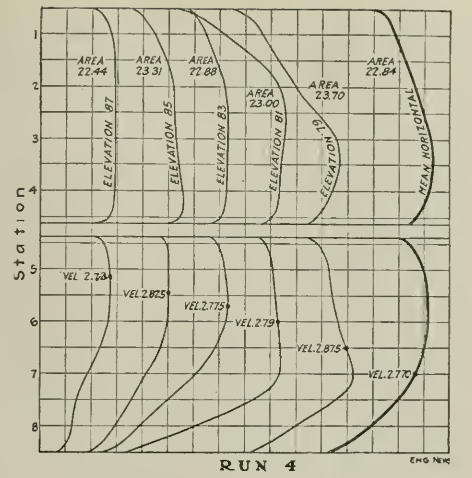

Fig. 8. Horizontal Curves

Velocity Curves Plotted from Meter Readings

Prior to and during the tests, the various methods used were discussed and gone over fully with the representatives of the Centralia Pulp & Water Power Co., G. E. Ackerman, of the Jacobson & Ackerman Engineering Co., of Minneapolis, who designed and installed the plant, and E. C. Gleason, of the engineering department of the Nekoosa-Edwards Paper Co. All points of importance were agreed upon as far as possible before the tests proper, and additional points that came up during the runs were taken up and settled to the satisfaction of all concerned. Gardner S. Williams, consulting engineer, Ann Arbor, Mich., was present during the tests by invitation from the Centralia Pulp & Water Power Co., and very kindly volunteered comment and suggestion. The tests were in charge of the writer under direction of W. M. White.

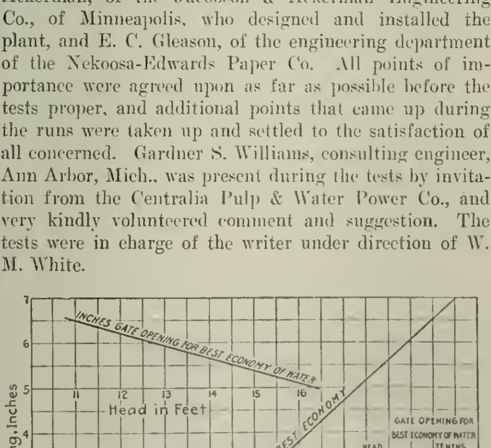

Fig. 9. Curve of Most Economic Gate Opening

At the termination of the tests the head and tail gages were carefully checked over. The check on the tail gage in No. 2 race showed that the gage was slightly off, in such direction and amount that the efficiencies calculated from the test readings should be reduced about ½%. Similar check on the gage in the forebay at the meter section showed a slight error, this being of such amount and direction that the efficiencies as calculated from readings should be increased $\frac{6}{10}$%. It was agreed that the two errors would balance, consequently no account is taken of them. After the tests, the wattmeters were carefully checked and were found to be accurate within $\frac{2}{10}$%. The greatest possibility of error lies in the measurement of the water and in the instrument transformers used for the wattmeters. As regards the former, measurements by the same meter under less favorable conditions of flow have checked within $\frac{4}{10}$% with simultaneous measurements made by a standard Francis weir. As regards the second error, which comes about by reason of the fact that the wattmeters were not calibrated in connection with the instrument transformers which they were used with, it may be stated that similar calibrations have shown maximum errors of about ½%.

Taking into account the above limitations and allowing for the fact that some inaccuracies may counterbalance others, it is believed that the major runs of the tests are accurate within less than 1%.

While the primary purposes of the test work were fulfilled in showing that the machinery exceeded the guarantees of performance, two additional features were of even greater interest. One of these items is of interest to engineers in general and has to do with the extent to which Holyoke test results on model runners may be taken to apply to a power-house setting. Analysis of the Holyoke test sheet as shown in the upper curve of Fig. 6 shows only slight but varying discrepancies in efficiency which are directly traceable to the limits of flume and draft tube.

The other item is of greatest value in connection with future operation of the plant. The record kept of actual gate opening as well as governor-dial reading made pos-

sude an analysis of power-house performance at the same under varying loads. In the operation of the plant, more or less small fluctuations will always be experienced on account of the variations of flow of the river, which may be increased by the operation of plants upstream (some under development), and because the pondage is limited. As the maximum output is desired at all times, it becomes of vital importance to operate the units to best advantage at all loads. Fig. 9 was based directly on the test data taken in the plant and at Holyoke, and shows graphically and in tabular form the approximate gate opening giving most economical performance at all loads.

The importance of test work of this nature and its influence on improvements in design are beginning to be more fully appreciated by power owners as well as by engineers and manufacturers. When it is considered that the entire cost of the test work described above was under $[illegible], it is evident that the expense involved is slight in comparison with the value of the information obtained, and practically negligible as compared to the entire cost of the development.

If test work of this nature is planned in connection with the initial design of the plant, it frequently occurs that various features tending to simplify the testing may be incorporated at practically no extra expense and not materially affect the commercial operation of the plant. It is hoped that this description in detailing the simplicity of method and low expense involved in carrying out typical work of this nature will serve to further encourage the increasing tendency toward carefully conducted power-house tests.

A Novel Portable Substation for the Berkshire Street Ry.*

The familiar advantages of a railway substation on wheels (insurance of continuity of power at low cost, elimination of idle reserve equipment, quick aid for disabled or temporarily overloaded stations, etc.) have been combined with the benefits of the now popular outdoor-type substation (greater safety of high-tension apparatus and elimination of building structures) by the Berkshire Street Ry. of Pittsfield, Mass., in the car shown by the accompanying illustration.

This portable substation consists of an inclosed operating compartment containing the rotary converter, the switchboard and the electric heaters; an inclosed central room for the lightning arresters; and an open section for the main transformer, the current transformer, automatic oil switches, choke coils, disconnecting knife switches, etc.

The car is all of steel (wood in the flooring) ($1\frac{1}{4}$-in. sheet). At the open end, four vertical and four upper channels form a cross-frame for the disconnecting switches and choke coils. A steel angle-iron frame extends from the cross-frame to a wood block on top of the transformer to protect the horizontal high-tension transformer bushings (brought out thus on account of low clearance). A similar cover protects the incoming-line leads and the connections to the arrester compartment.

The operating-compartment inclosure may be entirely removed for the installation or removal of apparatus. The section of the roof over the converter is also bolted down so that it may be readily removed for installing or dismantling the apparatus when a crane is available. A galvanized-sheet metal ceiling is built on the interior so as to form air pockets between it and the roof sheathing to prevent any direct radiation of heat when the car is standing in the sun and also to drain any condensation or possible leakage away from the apparatus. There are two doors into the converter room, a third between the converter and arrester rooms and one from the latter to the outdoor section.

The trucks have 33-in. wheels and are designed to take a curve of 40-ft. radius. The car conforms to M.C.B. standards throughout for passage over steam-railroad lines. The converter is a three-phase 25-cycle 600-volt 750-r.p.m. synchronous type, with commutating poles. The normal rating is for 300 kw. continuously, 450 kw. for two hours and 900 kw. momentarily.

The important data and dimensions are as follows:

Length overall	38 ft.
Width over eaves of car	8 ft. 4 in.
Maximum width (over side channels)	8 ft. 6 in.
Height overall (including running boards)	11 ft. 6 in.
Height of floor above rails	[illegible]
Total length of inclosed car	18 ft. 6 in.
Length of converter or operating room	11 ft. 6 in.
Length of lightning-arrester compartment	[illegible]
Length of outdoor section	[illegible]
Truck base	[illegible]
Wheel base	[illegible]
Wheels	33 in.
Track gage, standard	4 ft. 8½ in.
Total weight	[illegible] lb.

*From information furnished by the builders of the car described, the General Electric Co., Schenectady, N. Y.

Portable Substation of the Berkshire Street Ry., Pittsfield, Mass.

Location and Construction of Highways in Mountain Country

By F. W. Harris*

SYNOPSIS—This article deals with pioneer road building and road improving—in newly settled countries—when the problem is to get as many miles of good passable highway as possible for a fixed appropriation. The current practice of insisting on a maximum grade of 5% is deprecated and many of its fallacies shown. The construction of mountain highways requires especially light equipment and this requires special methods and implements. The author describes the very successful use of a Bagley dragline scraper on work under his supervision in Washington.

The object of this article is to deal with that type of highway location and construction where the end sought is "all the mileage that the money will build." This is based on the idea that in a new country two miles of good road is better than one mile constructed like a boulevard.

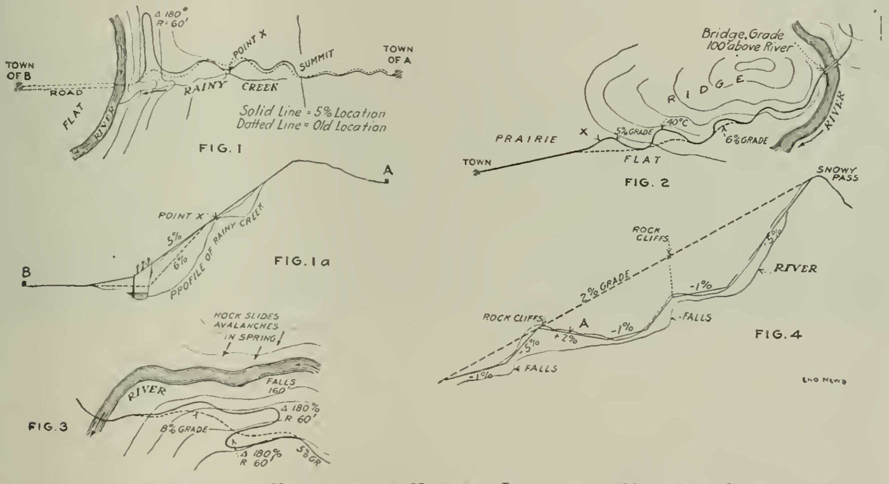
In the far West our problem is not building a particular section of road for a thousand years, but rather building a passable road and allowing posterity the next thousand years in which to improve the road when improvement is justified. By anticipating the wants of our grandchildren we only place such a heavy burden of taxation upon the present generation that *bona fide* efforts for road improvement are discouraged.

All highways are now designed for motor-driven vehicles and these are yearly increasing in efficiency. Observations by the writer show that light cars are a success on roads full of deep ruts and boulders. The light and so called under-powered cars are often given as one of the reasons for establishing a low rate of grade on highways, when in practice such cars have little trouble in ascending 15% grades even on badly surfaced roads.

Maximum Grades—Grade is not an object with the heavier type of motor vehicle; suitable surfacing is the most essential requirement. Automobiles of every rescription travel up 10 and 15% grades in the City of Seattle, Wash. Loaded motor trucks are daily ascending a 12% grade on a country road in the vicinity of Renton, Wash., and this rate of grade is a very common one in the hill country of western Washington.

Trunk-line highways through the mountains located on grades up to 8% will give a much better alignment in nearly every instance than the customary 5% limit now in vogue in this section of the country.

Alignment—Probably half the automobile accidents are due to curvature, and their prevention must be in good alignment, grades receiving secondary consideration. We cannot make our mountain roads fool-proof, but the careful tourist, unfamiliar with the road, is entitled to a chance to dodge the speed lunatics who drive through the hills at 30 mi. per hr.



Figs. 1-4. Examples of Uneconomical Highway Location in Mountain Country

Where the P. C. and P. T. are visible through the long chord of the curve, any degree of curve up to 40° is allowable. Curvature in cuts and around projecting bluffs should be kept down to a limit of 30°, even if the cost of construction is increased at such points.

A farmer or teamster would rather pull up a mile of 8% grade on a good alignment than a mile and a half of curves on a 5% grade, with a possible surprise party awaiting him at every turn of the road.

Examples of Uneconomical Location—The following are a few typical cases taken from located lines. In Fig. 1 the old road is dotted and is on a varying grade of 6% and 7%. The new road is located on a 5% grade. The loop shown was necessary to develop down to the bridge site, for the other side of the river was flat.

The alignment was not the worst feature, however, for

*Recently Locating Engineer, Washington State Highway Commission, Renton, Wash.

at the point *a* the road was almost to the creek, and at the bottom of a narrow ravine, where in November [illegible] little [illegible] the Grand Canal. Had a 7% grade been used at point *b*, and a thousand feet of [illegible] grade used there, [illegible] on a maximum 6% grade, the loop would have been eliminated and the [illegible] on the [illegible] approach to the bridge across the [illegible] would have been cut in half.

In Fig. 3 the elevation on the bridge site was fixed and the ridge [illegible] was followed down to the flat. The [illegible] was used to develop distance as the [illegible] [illegible]. Here [illegible] of 6% grade on the ridge would have eliminated 180° of central angle and [illegible] curves.

Fig. 4 shows a [illegible] development on a steep mountain side [illegible] 5% grade. The development is roughly 2 miles in length. Two [illegible] of 8% would have cut out the loops. The fall of 160 ft. in the river shows how steep the descent is.

To cut out the loops a line was run on the other side of the river, but this was only jumping from the frying pan into the fire, for that side was bare and rock slides and avalanches came down in the months of March and April.

Fig. 5 shows an approach to a typical mountain pass. By breaking grade and following the benches, the cheapest and straightest line is secured. Frequently these benches [illegible] and an adverse grade at point *A* is used. It is better to use an adverse grade than to continue on a straight descending grade and develop around these points. Adverse grades should be frequently used [illegible] of the ground. It will be found [illegible] to [illegible] 20 ft. [illegible] the original [illegible] conditions. Grade should be broken every [illegible] ft. if necessary.

One of the great advantages of a broken grade with an 8% maximum is that it enables the locating engineer to dodge costly construction work such as rock cliffs, bad slides and swamps. A road surveyed on a 2% maximum grade in Fig. 5 would allow the locating engineer no opportunity to avoid costly construction.

Even in the roughest mountain country [illegible] will probably have less than 8% grades.

[illegible]—[illegible] 10 ft. [illegible] on each side of the center line, will make a good map for projecting the location line if the preliminary line is [illegible] the [illegible]. Such a map will [illegible] the use of [illegible] and adverse grades. [illegible] of [illegible] to 1 mile in length can be located in the heart of the mountains.

[illegible] should be [illegible] and curves should be [illegible] from tangents. This [illegible] and results in greater economy. No curve [illegible] 100 ft. in length [illegible]. The location in heavily timbered country [illegible] a total [illegible] [illegible].

CONSTRUCTION

CLEARING WIDTH—Main [illegible] highways through the mountains should have a width of 100 ft. in [illegible] country where [illegible] can be acquired for a nominal sum. This provides for future improvements without the necessity of acquiring a new strip of right-of-way.

SLOPE WALLS—Dry-laid slope walls are a great aid in maintaining alignment on heavy rock work, as it is not necessary to make the rock cuts so heavy owing to the saving in embankment quantities by the use of walls. The thickness of a slope wall at the bottom should be 0.4 of the height; the batter, 0.5 ft. to 1 ft.; the thickness at the top, 1½ to 2 ft., and large stones should be set on top of the wall to serve as a guard-rail. The cost is from 70c. to $1.50 per cu.yd. Italians make good wall builders.

STATION WORK—The season for mountain-road construction is generally short—not over six months. As a rule this work has to be done by station men, and it is generally best to let the work to this class of labor. To that end the work should be made attractive to the station man by keeping the haul down to 200 ft. Work which has short hauls, even with light [illegible], is easily let when good work which involves a haul of 600 to 800 ft. goes begging.

CONSTRUCTION EQUIPMENT—It is always a hard matter to get supplies into a mountain country, so that equipment has to be of light weight, such as picks, shovels, mattocks and wooden wheelbarrows, drill steel and dynamite. This becomes more important where pack-horse trails lead to the work, for then there is no opportunity of hauling material at reasonable cost.

MINIMUM FILLS—In heavily timbered country, where consistent with drainage, the grade should be laid with an average of 2 ft. of fill. This will place the road on as good a foundation as the country affords. Shallow fills of 1 and 2 ft. should be avoided, as any number of inspectors could not watch station men close enough to keep them from making a stumpy fill. For drainage 0.5% should be considered a minimum grade.

DRAINAGE—On steep grades exceeding 5% in sand, clay and earth cuts the side ditches should be filled with 1 to 2 ft. of gravel or small rocks to prevent scouring and undermining the slope. This protection should be done when the finishing stakes are set, as it only requires about one day's heavy rain to pull the toe of the slope in the ditch.

CULVERTS—Timber culverts should be used in new work, as waiting for concrete pipes delays the work. All ordinary timber culverts last ten years and cedar culverts from 20 to 30 years. By the time the culverts are ready to be renewed a better idea of the drainage of the country is obtainable and facilities for hauling cement are [illegible].

[illegible] AND EXCAVATION—It is not advisable to attempt too much refinement in balancing quantities. Excavation should run about 1½ cu.yd. to 1 cu.yd. of embankment.

In timbered country 10% of the total excavation can be considered as [illegible], as it consists of [illegible] logs, roots, etc. Another 10% should be deducted for quantities lost in [illegible]. These percentages to be increased to 15% on each [illegible] where excavation averages less than 4 cu.yd. [illegible]. These percentages also vary with the locality. In the [illegible] Mountains in Idaho they would be about 5% in each case. On the western slope of the Cascades on the Washington and British Columbia coast 15% would not be too high.

ROAD-BUILDING MACHINERY—A great many attempts have been made to use machinery on mountain roads, but these have generally ended in failure. The most common-

ful machine in use that I know of is the Bagley scraper* and a logging donkey engine.

The donkey is first used to clear the right-of-way of logs, stumps, etc., and when this is done the scraper is attached to the same line. The accompanying illustrations show the manner in which this is done.

To work these scrapers successfully their limitations must be recognized. They are useless in mucking out solid rock. They handle all kinds of loose earth, gravel and boulders containing from 1 cu.ft. to ½ cu.yd. The material must be loose. When conditions are favorable they handle from 500 to 1000 cu.yd. per 10-hr. day.

A Bagley scraper can under favorable conditions handle excavation at 7c. per cu.yd., wherever a large fill is to be made with a short haul and the material is sandy or gravel. On general road work where time is lost in moving up, splicing lines, removing large boulders, etc., the average cost for handling material is from 15 to 20c. per cu.yd., to which must be added from 3 to 5c. per cu.yd. for finishing, as the scraper leaves the work in rough shape.

On the particular work shown in the illustrations two Bagley scrapers were in use, each having a capacity of 2½ cu.yd. One donkey engine was 11x13 in. in size; the other 10¼x10½ in. The advantage of the large size is that there are no delays waiting for steam pressure. The wire cables had the following dimensions: Main line, 1⅜ in. in diameter; haulback, ⅞ in.

Cost Data—The crew consisted of:

Foreman	$6.00 per 10-hr. day	
Engineer	3.50	
Fireman	2.75	
Hook tender	4.50	
Pump man	3.00	
2 rigging men, $3	6.00	
		$25.75
1 team hauling fuel, or 2 men cutting fuel on right-of-way		6.00
Fuel		10.00
Use of donkey, including depreciation of lines, etc.		10.00
Finishing gang—		
2 teams and teamsters, $6		12.00
4 laborers, $2.50		10.00
		$73.75

Assuming 400 cu.yd. for an average day's work the cost was 18½c. per cu.yd.

Where this output is cut down by encountering large boulders and rock ledges, the classification of excavation as rock offsets the decreased yardage to a slight extent. Changing the classification is not much help, as the scraper is only a money maker in good digging. Its use requires a very competent foreman and a first-class crew to handle the lines; a green outfit could not earn their board.

With plenty of fuel and water, with a short haul for the material not exceeding 400 ft., the scraper should average at least 400 cu.yd. per day.

The steam shovel is not adapted to mountain work, as it cannot pull itself around the way a donkey engine can, and the handling of cars on 5% grades is both difficult and dangerous. If it is impossible to avoid bad slides or swamps, these can be handled with a scraper at a minimum expense. The donkey-engine boiler can also be equipped with an oil burner to still further cut down haulage.

In light earth and gravel cuts a 2½-cu.yd. scraper will push another ½ cu.yd. of material ahead with a 200-ft. haul; it can easily move 1000 cu.yd. in ten hours. It may not be amiss to add that the scrapers do efficient work on channel changes and in loading gravel into bunkers from river beds. In channel change work the hitch should be placed so that the scraper is pulled upstream.

Bagley Scraper on Mountain Road Construction in Washington

Grade Stakes—The draglines tear out all slope stakes the first thing. The best system for referencing is to mark a tree as nearly opposite the stake as possible, or drive a heavy stake with the two cuts or fills marked on it and also a distance to the center line; thus,

C 4.0 C 8.0 Center 42.4 C 12.0

The last cut of 12.0 is an H. I. for getting grade; 42.4 is distance to the stake on the center line.

The road foreman sets off these reference distances using a hand level and a 16-ft. rod with the feet and five-tenths marked. At every foot is a small hook and to it is attached the ring at the end of a 50-ft. steel tape. The hook tender acts as rodman so that there is no waiting for the engineer to give grade. The engineer follows behind the donkey setting grades for the finishing gang.

With a crew that understands keeping their lines and grades, good progress can be made where, if they had to stop and wait for an engineer to give grade, the construction crew would be idle half the time.

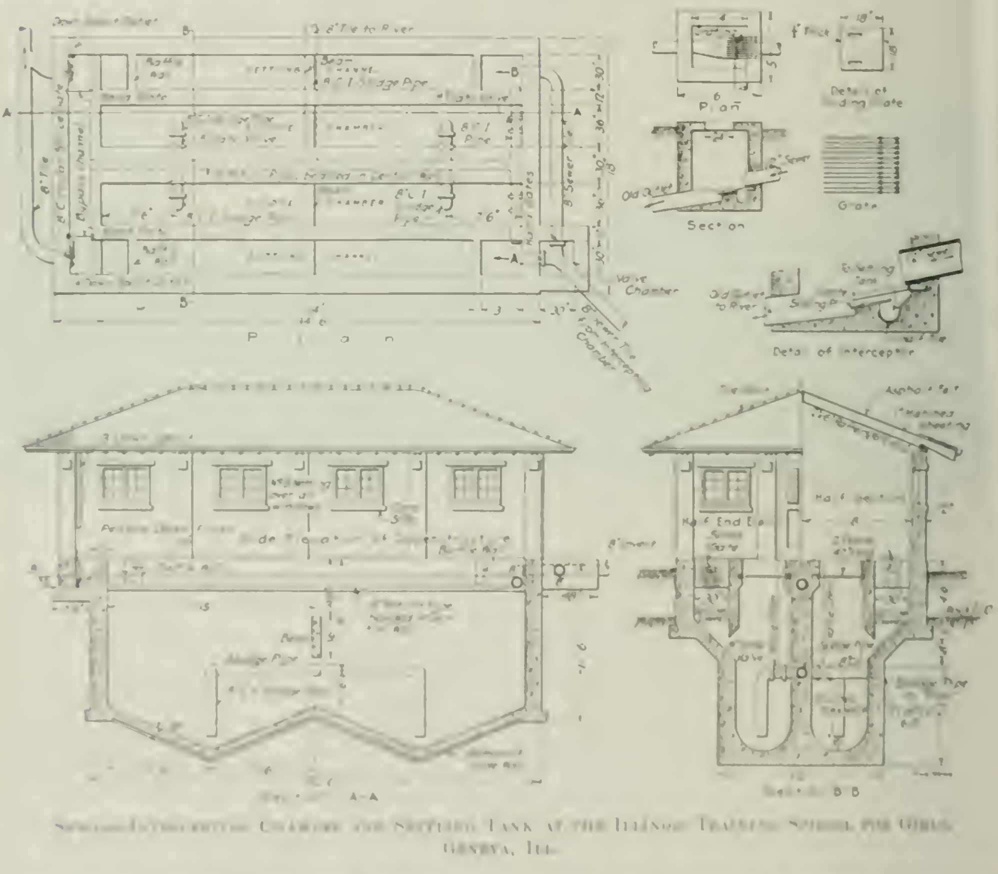
Sewage-Intercepting Chamber and Settling Tank for a Public Institution at Geneva, Ill.

At the Illinois State Training School for Girls, at Geneva, Ill., there are two sewage-settling tanks serving different sections of the institution, with capacity to take care of the sewage from a population of 600 and 400 respectively. The accompanying drawings represent the larger plant. At present the tank effluent is discharged directly into the Fox River, but some further treatment of the effluent may be required later. The tank is built close to the river bank and about 1000 ft. from the buildings which it serves, but is not visible from the buildings.

Originally the sewage was discharged at the east bank of the river through an outlet sewer. This sewer is now fitted with an intercepting chamber (A, B), constructed as shown in the accompanying details. The ordinary sewage flow falls through a grating into a trough leading to an 8-in. tile pipe to the treating plant. Sticks or other large objects are caught by the grating and carried forward to the old outlet. The main sewer from the institution receives the roof water, and any heavy stream of storm water flows across the trough to the old outlet sewer. An adjustable sliding plate provides for regulating the amount of flow to be caught by the trough of the interceptor.

The tank, as shown by the plan and sections, has two settling channels and two sludge chambers. These, normally, are to be operated in series, and with the direction of flow alternating in opposite directions, thus insuring an even distribution of the sludge. Thus the sewage at *A* flows through the first settling channel to the by-pass channel and then through an 8-in. return pipe in the central wall to the head of the second channel at *B*. From the lower end of this channel it enters the outlet pipe to the river. By adjusting the gates, the sewage may enter first at *B*, flowing to the by-pass channel and return pipe, and entering the second channel at *A*. If necessary, either channel can be operated independently, the sewage entering at the upper end and the effluent discharging into the outlet pipe at the lower end. The flow line in the channels is about 13 ft. above normal water level in the river. The rate of flow in the settling channels is about 40,000 gal. per day.

The unusual form of the channels and sludge chambers is designed to give ample capacity and to prevent the flow in the channel from interfering with or disturbing the sludge as it settles in the upper part of the chamber. In the longitudinal direction, the chamber forms



SEWAGE-INTERCEPTING CHAMBER AND SETTLING TANK AT THE ILLINOIS TRAINING SCHOOL FOR GIRLS, GENEVA, ILL.

two settling hoppers, into each of which depends the vertical end of the 8-in. sludge pipe. The sludge pipes unite in an 8-in. discharge which extends to the river.

The tank is of concrete, in proportions of 1 : 2 : 4. The water surfaces are given a smooth dense finish by waterproofing. The tank is covered by a concrete building with a stucco finish and a red tile roof.

Both of the tanks at the school were designed by the W. S. Shields Co., consulting engineers, of Chicago, and are now being built by the Nash-Dowdle Co., also of Chicago. The contract price of the two plants complete, including the intercepting chambers and the river outlets, which are short, was about $5800.

An Ambulance Train on an English Railway

In no previous war in the world's history have such measures been taken for the rescue and care of the wounded as are now being adopted in Europe. In all the countries now engaged in war, special trains have been fitted up for the transport of those of the wounded able to bear the journey from the field hospitals at the front to permanent hospitals in cities far removed from the scene of action.

INTERIOR OF A HOSPITAL CAR ON THE GREAT EASTERN RY. OF ENGLAND

The accompanying view shows the interior of one of the cars of an ambulance train on the Great Eastern Ry. of England. It might be thought that the English compartment cars, with side corridor, would be better adapted for hospital purposes than the American type of car with its central passageway. The latter, however, has the great advantage of providing a much larger amount of accommodation in a given space

To adapt the English car to its new use, therefore, the compartment partitions were removed and all the side doors were permanently fastened, except one pair at the end of the car formerly used by the guard and luggage. Wooden studs were then fastened to the car sides and to these were secured two tiers of hinged metal berths arranged to fold up against the sides of the car when not in use. The lower berth has its outer edge supported by legs extending to the floor and the upper berth by inclined struts running back to the side of the car. The limitations of English rolling stock make this arrangement less roomy than would be possible on an American railway. In the car illustrated, the clear width inside is 8 ft. 9 in., and the berths are 2 ft. 6 in. wide.

Besides the cars made up with berths in this way, other cars of this hospital train contain accommodations for the surgeons and nurses to attend the wounded. There is a kitchen car for the preparation of food, compartments containing medical and surgical supplies, an office for the chief surgeon in charge of the train and an operating room.

Bacteriological Standards for Drinking Water Supplied in Interstate Commerce

Bacteriological standards of purity for drinking water supplied to the public by interstate common carriers were promulgated on Oct. 21, 1914, by W. G. McAdoo, Secretary of the Treasury (acting in behalf of the U. S. Public Health Service), as follows:

The following are the maximum limits of permissible bacteriological impurity:

1. The total number of bacteria developing on standard agar plates, incubated 24 hr. at 37° C., shall not exceed 100 per c.c. Provided, that the estimate shall be made from not less than two plates, showing such numbers and distribution of colonies as to indicate that the estimate is reliable and accurate.

2. Not more than one out of five 10-c.c. portions of any sample examined shall show the presence of organisms of the bacillus coli group when tested as follows. [Technical details omitted here.—Editor.]

3. It is recommended, as a routine procedure, that in addition to five 10-c.c. portions, one 1-c.c. portion and one 0.1-c.c. portion of each sample examined be planted in a lactose peptone broth fermentation tube, in order to demonstrate more fully the extent of pollution in grossly polluted samples.

4. It is recommended that in the above-designated tests the culture media and methods used shall be in accordance with the specifications of the committee on standard methods of water analysis of the American Public Health Association, as set forth in "Standard Methods of Water Analysis" (A. P. H. A., 1912).

The standard given is one recommended by a commission of 15 chemists, biologists and sanitarians appointed by Secretary McAdoo on Jan. 22, 1914.*

In concluding its "progress report," the commission states:

In submitting the recommendations herewith presented it may be again emphasized that the limits defined are recommended with reference solely to the special object of the control of the supplies of common carriers, having in mind that these supplies constitute a special case because of the following reasons:

1. The supplies come from widely diversified and mixed sources.

2. Samples taken from common carriers represent water stored for various lengths of time under varying conditions.

3. In view of the impossibility of accurately ascertaining the source and history of each supply examined reliance must be placed upon the results of laboratory examination to a greater extent than is necessary or justified in estimating the quality of a supply from a known source with a known history.

It is requested that the recommendation of these hard-and fast limits of bacteriological impurity be not interpreted as

*The names of the members of the commission, a "progress report outlining the problem which confronted the commission, and fuller technical details for determining the standards are printed on pp. 2959 to 2966 of "Public Health Reports" (Washington, D. C.) for Nov. 6, 1914 The chairman of the commission is John F Anderson, Director Hygienic Laboratory, U. S. Public Health Service, Washington, D. C.

Use and Tests of Unscreened Gravel: Illinois State Highway Department

By [illegible]

For a number of years the Illinois Highway Department has [illegible] the use of unscreened or pit-run gravel for concrete in the building of highway bridges.

The specifications provide that such gravel be of standard quality and that cement be proportional to the sand

FIG. 1. GRAVEL-TESTING OUTFIT USED BY THE ILLINOIS STATE HIGHWAY DEPARTMENT

[illegible] in the gravel. For instance, "Class A" gravel concrete must contain 1 part of cement to each $2\frac{1}{2}$ parts of sand, [illegible] the resulting concrete may vary from the equivalent of a 1 : $2\frac{1}{2}$: [illegible] mixture to a [illegible] mixture. Sand is defined as that portion of the gravel which will pass a $\frac{1}{4}$-in. screen.

[illegible]

[illegible]

[illegible]

It is somewhat unusual in testing a carload of unscreened gravel to find a total variation of more than 5% in the sand content. It is not unusual to find as great a variation as this in aggregate artificially proportioned by methods in common use.

GRAVEL TESTER

In order to facilitate making tests of unscreened gravel, the writer devised the testing outfit shown in the illustration, Fig. 1.

At the left is shown the testing can, which is provided with a close-fitting telescope cover. The testing can serves also as a convenient carrying case when provided with a shawl strap as shown.

The various articles to the right nest one within the other from right to left and fit in the main receptacle or testing can. There is room also to pack the inspector's hand level, a 50-ft. steel tape, a 5-ft. folding rule, and, if not too bulky, a set of bridge plans. Fig. 1 shows only the articles used in testing. All of the articles except the scale and the 200-c.c. glass graduate are made of galvanized iron.

The testing can is [illegible] in. in diameter and without the cover is exactly 10 in. deep inside. The scale is 10 in. long and is graduated to inches and tenths.

The screens used by the Illinois Highway Department have $\frac{1}{2}$-, $\frac{1}{4}$- and [illegible]-in. square openings. The $\frac{1}{4}$-in. screen is used to determine the ratio of sand to gravel. The [illegible] and [illegible] screens are used to check the gradation of the sand and stone, respectively. Obviously, any other set of screens may be substituted if desired.

The can of small diameter is used as a protector in which to pack the glass graduate and for washing sand in making the clay test. The 200-c.c. graduate is used for measuring [illegible] sand and sediment in the water-settlement test for clay.

TESTING GRAVEL

In testing the sand for clay, [illegible] c.c. of sand screened from the gravel are measured by means of the graduate

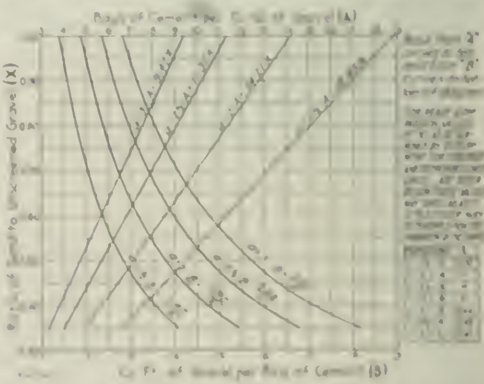

FIG. 2. DIAGRAM FOR USE IN PROPORTIONING CEMENT TO UNSCREENED GRAVEL

and poured into the smaller galvanized can. The sand is then washed repeatedly with clean water until the water runs off clear. The wash water is poured into the gravel can and allowed to settle. When clear, the water is [illegible] down to about 200 c.c., which should contain all the [illegible]

This is poured into the graduate and at the end of three hours, the depth of sediment is read. The reading divided by two equals the percentage of clay.

The results obtained by the water-settlement test (three hours' time) have been found, by a large number of determinations, to be from two and one-half to three times as great as those obtained by dry volume or weight tests. The ratio of the settled volume to dry volume is not constant, but varies with the character of the sediment. If, therefore, the water-settlement test shows between two and one-half and three times the allowed dry volume, the test should be confirmed by a dry volume or weight determination.

It has been found that volumetric determinations of the percentage of dry clay correspond very closely with weight determinations. The water-settlement test is very simple and the only practical one for field use.

A graduate having an internal diameter of about 1 in. is recommended, as the readings may more accurately be made than in tubes of greater diameter.

Washing with repeated changes of water is essential, as all of the sediment is separated. Merely shaking 2 or 3 in. of sand in the tube with clear water and allowing the whole to settle leads to error: first, because of the sediment in the muddy water contained in the voids of the sand; second, there is no check on the thoroughness of the washing, and third, the dividing line between the fine grit and clay is not always distinct.

Repeated changes of clean water separate all of the ediment, and, in addition, the number of changes required affords a means of judging the practicability of a thorough washing of the gravel, if washing proves necessary. Sand containing soft grains may also grind up in the process of washing. The necessity of many changes of water may indicate a material which will grind to powder in a mechanical mixer and is therefore unfit for use.

To test a sample of gravel for sand ratio, the testing can is filled level full with the selected sample of gravel, and the sand and stone are separated by the use of the ¼-in. screen. The sand and stone may be caught on newspapers and poured separately in the testing can for measurement. As the can is cylindrical in form and $\frac{1}{10}$ in. represents $^1/_{100}$ of the depth of the can, the reading of the scale, when placed in the can zero end up, represents to the nearest 0.01 the ratio of the volume of sand or stone to the volume of the original gravel.

The amount of sand or stone in any given volume of gravel may be found by applying these ratios. Convenient formulas may be written for determining proportions. The following notation will be used:

- x = Ratio of volume of separated sand to volume of unscreened gravel;
- y = Ratio of separated stone to unscreened gravel. (For well graded gravel $x + y$ should be from about 1.10 to 1.25);
- a = Required ratio of sand to cement;
- b = Maximum ratio of stone to sand;
- A = Bags of cement required per cubic yard of gravel;
- B = Cubic feet of gravel to use with one bag of cement;
- C = Amount of stone to add to a unit volume of gravel in order that the minimum amount of cement may be used.

Considering one bag of cement to contain 0.95 cu.ft., the following formulas may be written:

$$A = \frac{27\,x}{0.95\,a} = \frac{28.4\,x}{a}$$

$$B = \frac{0.95\,a}{x}$$

$$C = bx - y$$

The following example illustrates the use of these formulas:

Assume that a batch of gravel tests 0.60 sand, and 0.50 stone, and that the mortar ratio is to be as one of cement to 2½ sand.

$$x = 0.60;\ \ y = 0.50\ \text{ and }\ a = 2.5$$

$$A = \frac{28.4 \times 0.60}{2.5} = 6.8$$

$$B = \frac{0.95 \times 2.5}{0.60} = 4.0 \text{ (practically)}$$

If it is desired to add stone to the above gravel in such quantity that the proportions may be represented by the formula, 1 cement, 2½ sand, 5 stone, then $b = 2$ and $C = (2 \times 0.60) - 0.50 = 0.70$.

One bag of cement would be used with 4 cu.ft. of gravel and 2.8 cu.ft. of stone.

The diagram, Fig. 2, is plotted from the formulas for A and B, and affords a convenient method of determining the amount of cement required when unscreened gravel is to be used.

Boiling Test of Cement

The gravel tester may conveniently be used for making the accelerated or boiling test of cement in the field. Temporary wire shelves are fixed in the screen of largest diameter. On these shelves are placed the glass plates, which should be cut roughly circular in form. The screen then forms a rack, which with the pats in place may be placed in the testing can. The testing can then serves first as a moist closet and later as a receptacle in which the pats are boiled. Fig. 1 shows the large-mesh screen arranged with two pats in place. Standard methods are used in making the test.

Conclusions

With the outfit described, after a little practice, an inspector can make a sand test in about 70 sec. It is practicable, therefore, particularly on small work, to test every wagon load of gravel before it is dumped and by dumping loads bearing practically the same sand content in separate piles, the proportioning is very simple.

Ordinarily, two or at the most three separate piles will provide means for fully as exact proportioning of cement as is ordinarily secured with screened materials.

Commonly, however, such frequent tests are not necessary, particularly when the gravel is handled a number of times between the pit and the site of the work as in case railroad transportation is required.

Except in making preliminary tests at the pit, for the purpose of determining what the character of the delivered material is likely to be, it is not necessary or desirable to select representative samples and by mixing and quartering endeavor to secure an average sample.

Modifications of the testing outfit and methods of proportioning described have been used by the Illinois Highway Department on bridge work for several years. The results obtained are considered to be entirely satisfactory. The testing outfit is not patented.

The New York Rapid Transit Railway Extensions*

By F. Lavis†

X--Tunnels in City Streets

The Lexington Ave. Tunnels

With the exception of the tunnels under the rivers, referred to in the next article, practically the only parts of the subway lines as now laid out, to be built as true tunnels, are those under Lexington Ave. for the two lower-level tracks from about 53rd St. to 78th St., and for all four tracks from about 91st St. to 102nd St. The total length of these four sections is about 2.6 miles, of which about 2 miles is to be built in tunnel. The tunnels on Sec. 9 are being driven in part by Messrs. Douglas & Shaller, under a subcontract for P. McGovern & Co. The rest are parts of Secs. 10 and 11, and are being built by the Bradley Contracting Co.

No particularly new methods of driving these tunnels or of handling the material have been used, but some features of the work are of interest on account of the difficult and uncertain nature of the rock which has been encountered. This is the typical gneiss or mica schist which underlies the whole of Manhattan, varying from quite hard to very soft and partially disintegrated material, containing many seams and dipping and striking very irregularly, thus tending to cause slips and slides, which the utmost vigilance and care cannot always avoid. Driving a tunnel, therefore, or even making an open cut through this kind of material under a street carrying heavy city traffic, and with important buildings on both sides of it close to the work, requires most careful methods of excavation.

On Sec. 11, the situation is complicated by the change from double-deck, two-track tunnels, one over the other, to a four-track section, with all the tracks at one level, making a tunnel section of practically rectangular shape 17 ft. high and nearly 60 ft. wide (see Fig. 68).

A power plant which supplies air to all four of these sections was established by the Bradley Contracting Co., at 96th St. and the East River. It contains five compressors, each of a rated capacity of about 2100 cu.ft. of free air per min., which is piped through a 10-in. main to all sections, the distance from the power house to the center of the farthest section being about 1½ miles. Comparatively little trouble has been experienced with this line, though of course, with four contractors and their large organizations depending on one source for their supply of air, there have been times occasionally when all would be working or attempting to work at full capacity and the pressure would consequently drop.

A supplementary compressor of about 1000-cu.ft. capacity, connected to an electric motor, for use in emergencies has been installed in a part of the temporary subway on Sec. 9, at 77th [illegible] St., but so far it has not actually been used. There has been some trouble on the long pipe-line lines with freezing in cold weather, but nothing of importance. The main is carried underneath the decking of the plant.

The Bradley Contracting Co. arranged for the hauling and disposal of the muck from Sec. 9, as well as from all its own sections, so the same type of buckets are used throughout all four sections; they are the so-called bottle-tops already referred to in the article on excavation.

In the tunnels, four small power shovels (Marion model 40) were used for handling the muck in as many headings, where there was room for them, but a great deal of the material was handled by hand shoveling. Some experiments were made with other types of mechanical excavators, designed for use in a more limited space than that necessary for the operation of a shovel, but they were not successful enough to warrant their continued use.

The buckets, placed on small four-wheel cars (Fig. 66, lower view), were hauled back and forth between the shafts and the headings by various means, but no mechanical locomotive power was used. Single-drum air hoisting machines were arranged on platforms above the floor of the tunnel to haul the cars up grade, either the loads out of the heading or the empties back as the case might be, the cars being allowed to coast down grade. A single haulage line was used, the end being carried back by hand or by a mule.

Where the rock was good the full section of double-track was usually taken out by driving a top center heading about 8 ft. high and 12 ft. wide, keeping the enlargement close up. The heading was pulled by the usual V-shaped center cut, with necessary side rounds, 30 to 40 holes 6 to 8 ft. deep, according to the character of the rock, being required for the whole heading. About 5 lb. of 60% dynamite was required per cu.yd. in the headings in hard rock, 40% was used in the softer rock.

In one case a pilot heading was first driven all the way through between two of the shafts to permit better ventilation, especially for the erection of the structure, which it was desired to keep fairly close up to the excavation.

Timbering was required to support the roof in many places, and although segmental timbering was used, the arch was so flat that intermediate supports were almost always required. The original design for the double-track tunnels provided for a reinforced-concrete center wall, but here as in the use of this kind of material in the cut-and-cover sections, where the ground at the street surface required continuous support, it was found to be difficult to make a good job with it. The type of structure shown in Fig. 9 permits the construction of the center wall from the two benches, as shown in outline, before the roof of the structure is built and permits support on the permanent steel structure at once. This method is shown also in the sketch Fig. 77, which shows the various stages of construction in the double deck, double-track tunnels on Sec. 11 and also incidentally the enlargement for the upper level local station at 96th St.

Figs. 69 and 70 show typical methods of supporting the timbering and the rock above, where the latter was generally fairly good. The methods used varied in detail in different headings, but in general were more or less

ring erected, in the position in which poling boards would usually be driven. These projected forward over the position of the next ring and were blocked up from it after it was erected. This slight variation from the method of placing the lagging provided some protection from small dropping rocks, and was more easily accomplished than driving the poling boards, which would have been difficult in the material excavated.

The general appearance of this timber section is shown in the upper left view in Fig. 66, but in some parts of the work where the ground was particularly heavy, the space between the timber rings was filled with concrete, as soon as possible after they were erected, and the ground overhead was thoroughly grouted. Even then it was necessary to use some temporary supports for the center. Details of two types of timbering used are shown in Figs. 69 and 70.

As is indicated in this latter drawing, the wall plates were sometimes supported on a ledge of rock, but more often were posted down to subgrade when the bench was

alike. The flatness of the arch will be noted and the supports on either side of the center wall, permitting the construction of this latter and the transference to it of the load, thus permitting the construction of the two arches.

Near the upper end of Sec. 8 and 9, from 56th to 78th St., very soft disintegrated rock, carrying considerable water, was found, necessitating typical soft-ground tunneling methods. Timbered side drifts were driven for the wall plates, segmental timbering tightly lagged was erected from them with about twelve inches between each ring, crown bars and poling boards were used, but the latter were not usually driven, as the rock would hold for a short time. The method actually used was really to place lagging over the top of the arch in the position of poling boards, wedged down at one end, over the last

excavated. The raking braces shown were usually only used temporarily to help support the wall plate while the posts were set under in very soft material, but occasionally they were left in.

Fig. 71 shows a method of timbering used as part of Sec. 9 south of 78th St., where the rock, while quite hard, required support to prevent slides or the possible movement of large masses. A center top heading was driven and as soon as the enlargement was made, which was kept close up, the timber was erected, as shown in the "first stage" cross-section. In the "second stage" the two pairs of continuous I-beams are placed to span the bench excavation as shown in the longitudinal section in Fig. 70. These I-beams were joined with long splices to develop full strength at the joints and were made continuous throughout the work. The muck from the heading and

enlargement was brought out in small buckets on the tracks, laid on the cross-braces at the springing line and dumped into the buckets on the tracks below, at a point back of the face of the bench.

All timber is provided and placed by the contractor at his own expense, the cost being included in the excavation price. The extra excavation necessary to place the timbers outside the lines of the structure is also at the contractor's expense, the payment line being confined to the neat line of the structure. Concrete placed between the timbers, however, is paid for where ordered, as is also the grouting.

At some places a center top heading was driven ahead, then the enlargement was made all on one side just large enough to permit the steel and concrete structure for one track to be built in it, then the further enlargement was made for the second tunnel, the top of the center wall forming the abutment for the arch first erected being necessarily braced to the sides until the second arch was erected. This method obviated the necessity of anything but occasional support of the rock where there appeared to be a tendency to slip.

On Sec. 8 and 9, the cut-and-cover excavation for the upper-level tracks was quite generally completed and the structure erected in it before the tunnel underneath was driven. No damage to the upper structure or difficulty of moment has been experienced due to this method of procedure except in one or two cases, where the extremely heavy rains of last fall, working under the completed upper structure, washed some of the material under it, into the excavation of the tunnel below, the heading of which happened at that time to be in very soft disintegrated rock. The upper tunnel structure at this point was temporarily supported by heavy timbers and girders which spanned the washed-out portion and the latter was then thoroughly grouted and the trouble remedied. Close watch was kept at all times of the upper tunnel at points just above the places where work was being carried on below, and any indications of trouble, as were shown in one or two cases by small cracks, were investigated and the ground below thoroughly grouted if this appeared necessary. The efficiency of this grouting under high pressure was shown in one case where grouting was done from below, the grout being forced up into the upper tunnel.

Just north of 98th St., the two upper tunnels spread out, and as soon as they get far enough apart, drop down to the level of the lower tunnels, until all four are at the same grade, as shown in Fig. 68-I. Working from the shaft at 97th St. toward the north, the two lower tunnels are being driven first and the steel and concrete structure erected in them, then the two upper tunnels are to be driven at the sides. The cross-section *C* will show the necessity of this, as it will easily be seen that the corners *X* and *Y* will probably break through, and the character of the rock is such that it would hardly be possible to hold up the mass between.

At the upper end of this section at 102nd St., working southerly in the four-track section (Fig. 68), the method which has been developed and started is based on the idea of driving one side of the tunnel first for a distance of about 80 ft., then erecting the structure in it, then starting the second tunnel, and so on, thereby avoiding having the excavation open for more than the width of one tunnel at once.

Some difficulty was experienced in catching up some of the portals, a typical method of overcoming it being shown in the sketch, Fig. 68-II. At the beginning of the double-deck tunnel just south of 95th St., the lower level was driven through, the steel structure erected and concreted, then the upper level was worked back from the inside to the portal, as shown.

At the portal at 102nd St., where the four tracks are all at one level, a side drift was driven for a length of almost 80 ft., a crosscut was then made from this drift the full width of the structure, as shown in the sketch, Fig. 68-III, and the structure then erected so that the rock was caught up and then the excavation carried back out to the portal.

Vesey St. Iron-Lined Tunnels

On Sec. 1-A of the Broadway line there is a reversed curve where the route passes from Church St. through Vesey St. to Broadway, and the narrowness of the streets makes it necessary to pass under private property at each of the corners. The material for a considerable depth (50 to 60 ft.) below the streets in this section is sand, but it is comparatively dry down to the level of the bottom of the subway structure, which latter is about 4 ft. below M.H.W.

Easements were obtained under the two pieces of private property referred to, namely, the Trinity Parish House and the old Astor Hotel, on condition that the former should be properly supported on new foundations, bridged over the tunnel, and that on the site of the latter (which was razed) suitable foundations for the heaviest type of building should be provided, also, of course, bridged over the tunnel where this passed through them. Under these conditions it was thought desirable to design two separate circular cast-iron lined tunnels or tubes. The two tubes together have a length of about 1200 ft. and will require about 4350 tons of cast iron for the lining and about 17,000 cu.yd. of concrete.

As these sections of iron-lined tunnel are comparatively short, the use of the usual type of pneumatic shield for driving them would have involved a somewhat high cost for plant, chargeable to only a small amount of work. Besides this, the driving of tunnels by the shield method on curves of as small radius as this is a somewhat difficult operation, though on the Hudson & Manhattan R R. there is at the corner of Morton and Greenwich St. a curve of 150-ft. radius, which was successfully driven by the use of the shield. The diameter of these tunnels was, however, some 3½ ft. less than those at Vesey St.

The contractors, Messrs. F. L. Crawford, Inc., adopted therefore, for this work, a method developed by them and their engineer, J. C. Meem, M. Am. Soc. C. E., some years ago in the construction of some large circular brick trunk sewers in Brooklyn and which was quite fully described in a paper presented by Mr. Meem to the Brooklyn Engineers' Club in May, 1905.

This method as modified for the construction of these tunnels is shown quite clearly in the drawings and photographs, Figs. 73 and 74. A top heading is driven, the roof protection being afforded by the five sectional shields or jills, a detail of which is shown in Fig. 74d, and the front end in the photograph, Fig. 73-1. These are shoved ahead by hydraulic jacks, and a lining of 2-in. hardwood lagging put in behind them, under the tail; this is temporarily supported by crown bars and blocking, which

[illegible] the drawing, Fig. [illegible] and [illegible], and the photograph, Fig. [illegible]

[illegible]

[illegible] ... the bottom of the heading.

This permits the advancement of the so-called pilot [illegible] ... the center in the position [illegible]

[illegible] to fit the curvature. The girder flanges are [illegible] angles, and the lattacing [illegible] angles. The girders are 3 ft. on centers held together and braced by [illegible] bars. The roof load of the tunnel, which the girder supports, is estimated to be about 10 tons per lin. ft., but the girders are designed to carry a maximum load of [illegible] tons per lin.ft. for spans of 12 ft., thus providing for uncertainty and probable irregularity of loading and support.

The hardwood lagging is left in place when the cast-iron lining is erected. This latter weighs approximately 6600 lb. per lin.ft. of tunnel and it is cast in the usual segmental form. The individual segments are 6 ft. 2 in. long, 20 in. wide and weigh about 1500 lb. each. Every fifth ring is a taper ring for the curves, other taper rings (with considerably less taper) are provided for correcting the alignment when this becomes necessary.

The Ordinance to Reduce Elevator Accidents [illegible]

The Design and Maintenance of Sewage-Treatment Works*

The use to which a stream is put and the available water for dilution should be factors in the design of every plant, and treatment should not be carried further than is made necessary by the conditions of the stream which is to receive the sewage after treatment. Where streams are used as sources of water-supply for near-by towns, a higher standard of effluent is required than where the purpose of the treatment works is only to prevent nuisance.

All disposal works should be recognized as machines which require intelligent supervision and which, if properly designed and maintained, can be made to produce just that quality of effluent which the diluting capacity of the local stream will render satisfactory. In this way greater general progress in the betterment of stream conditions will result.

It will frequently happen that, in small streams, the dry-weather flow can, with profit, be increased by the intelligent use of stored upstream water, and the discharge of a partly treated sewage thus made possible at all seasons.

Where the two-story type of tank is adopted care must be exercised that the tanks are not made too large, as under such circumstances they are liable to fail of their purpose by reason of the sewage in the settling chamber becoming septicized and creating nuisance.

PATENTED PROCESSES—Town authorities should not deal with the proprietors of any patented processes or devices for sewage treatment without the assistance of some competent advising engineer.

The treatment of sewage has always seemed to be a particularly fertile ground for the exploitation of patented methods, from the early days of the many processes of chemical precipitation to the present-day electrolytic treatment; many of these schemes, while apparently successful in the experimental plants, are entirely infeasible on a practical scale. There is danger in deducing results from small test apparatus without scientific study by a qualified expert; often the cost of such treatments, when undertaken practically, is prohibitive. The proprietor of a process who is looking for a contract will give a bond and make various propositions which appeal to the people of a town and in this manner lead them to favor the acceptance of such propositions. Many costly mistakes have been foisted on communities in this way.

PROCESSES OF TREATMENT

SEDIMENTATION AND SLUDGE DIGESTION—Usually the first process of treatment is the removal of the solid matters which have been maintained in suspension by the velocity of flow in the sewer. In the past, when the solids were allowed to settle in tanks in which the sewage flowed over and in contact with the putrescent deposits in the bottom, odors resulted. Also, when the deposit from such tanks, called sludge, was placed upon the ground or upon drying beds, the foul emanations added to the nuisance. But within recent years, two-story tanks have been devised and are in successful operation whereby the sewage is settled for a short period of time in the upper story and the sludge allowed to remain in the lower compartment of the tank sufficiently long for the decomposable matters to digest, and the settling sewage is kept from coming in direct contact with the digesting sludge.

Such tanks will discharge an effluent practically free of settleable matter in nearly as fresh a condition as when received. The gases evolved during digestion of the sludge away from contact with the sewage are principally methane or marsh gas and carbon dioxide, both of which are inodorous. Sludge withdrawn from such tanks after digestion is inoffensive, dries quickly and may be used for filling low land or for agricultural purposes with no danger of nuisance.

OXIDATION—If the conditions require more refined treatment than sedimentation, it becomes necessary to adopt processes for oxidation. This may be accomplished by means of intermittent sand filters, contact beds or sprinkling filters, the choice of which is largely dependent on the availability of different construction materials and the size of plant to be installed. Intermittent sand filters are only economical where large areas of sandy soil are available. The sprinkling filter, on the score of economy and on account of the maximum efficiency secured on a minimum area of land, is generally given preference; yet under certain conditions contact beds are justified.

The present-day tendency is to adopt processes which will maintain, as far as possible, aërobic conditions in the liquid at all stages through the plant; the maintenance of such aërobic conditions is the primary consideration in avoiding nuisance.

DISINFECTION—As the purpose of disinfection is the destruction of pathogenic bacteria, in order to provide a double safeguard against water-borne diseases, it can be generally said that disinfection of sewage is an unnecessary refinement, unless the effluent of the sewage-treatment works is discharged into a water course adjacent to and above the intake of a water-purification plant, and even in such a case the responsibility of protecting the public health should rest upon the purification of the water.

It is not practical to disinfect crude sewage containing particles of organic matter of appreciable size, as with the usual period of contact it is impossible for the disinfectant to penetrate the solids.

ODORS AND THEIR AVOIDANCE

The amount of odors depends largely on the freshness of the sewage and the method of treating and handling the sludge. The freshness of the sewage depends largely on time of travel and the design of the collecting system, on the adaptation of size to discharge, the provision for self-cleansing velocities and on the ventilation of the sewers so as to provide as much natural aëration to the liquid as possible. If the sewage is fresh or if, in other words, it contains dissolved oxygen, there will not be serious odors from the application or treatment of the liquid portion, provided the plant is maintained with no lodgment of sewage in pools or overloading of the surface of the filters.

There is a potential cause of odors in the sludge. But by the use of the more modern type of tanks, with thorough digestion of the decomposing solids and discharges on properly prepared sludge-drying beds, under favorable

Making Sewage-Works [illegible]

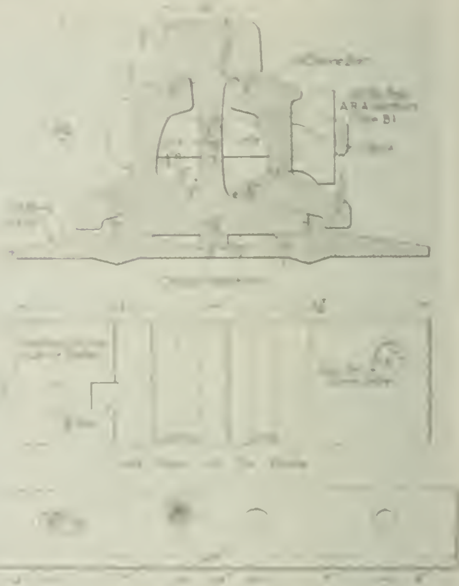
[illegible]

Traffic through the Panama Canal [illegible]

Rail Joints and Tie Spacing

In the work of rail renewals it has been general practice to shift the joint and shoulder ties to adjust them to the position and specified spacing at rail joints, since the joints of the new rails rarely coincide exactly with those of the old rails. This shifting of the ties and handling of ballast involves considerable work and time, and a large number of men; in fact, rail-renewal gangs of [illegible] men employed on one railway have [illegible] of these men assigned to the spacing of ties.

It will be understood that the shifting of the ties results in a disturbance of the ballast and of the firm roadbed which has been secured by months of tamping and maintenance work, and several months of such work will be required again to restore the roadbed to its former condition. This means that much of the expense due to



Rail Joint with Heavy Section Rails, Pittsburgh & Lake Erie R.R.

J. A. Atwood, Chief Engineer.

[illegible]

the position of ties is not changed [illegible] charged to ordinary maintenance.

There is a growing doubt as to whether this work is necessary, and whether it is worth the expense and trouble involved. This is especially the case for main track laid with heavy rails and splices. Some amount of tie shifting will be necessary where the splices are of a type that [illegible] the rail base, or where the old plan is followed of slot-spiking the splice bars to prevent creeping of the rails. In modern practice, however, the tendency is to use rail anchors or anti-creepers for this latter purpose.

The practice of laying new rails without reference to the position or spacing of ties at the joints has been adopted by some important railways, and with entirely satisfactory results.

The Pittsburgh & Lake Erie R.R. has followed this practice for two or three years. The rail joints are spliced with bars of high-carbon oil-tempered steel, having a large proportion of metal in the top chord, as shown in the accompanying cut. These are hot-punched for the bolt holes. The use of slotted splice-bars has been discontinued for several years, as it was believed poor practice to rely on the joint ties to prevent creeping. It is considered that the preferable method is to use sufficient anti-creepers to prevent such movement. The maintenance engineers and the track men are convinced that the practice of keeping ties with uniform spacing, and regardless of the position of the rail joints results in considerable direct and indirect saving, while the track rides very easily.

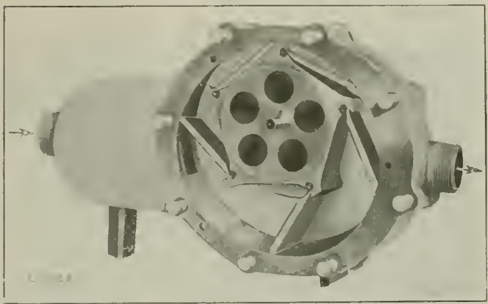
The Illinois Central R.R. has adopted (in 1914) a new design of heavy high-carbon angle splice-bar for 85- and 90-lb. rail. The bar is not slotted or punched for spikes, as it is intended to use anti-creepers to hold the rail where there is any tendency to creep. No attention is paid to the spacing of the ties when the new rails are laid, and respacing will be done only at such times as the track is surfaced "out of face." It is considered that a great economy in rail-renewal work is effected in this way. The same conditions apply on the Lehigh Valley R.R., where the opinion is held that the respacing of ties involves an expenditure of time and money that gives no good results, while the time might be spent to much better advantage in maintenance work upon the track.

A Direct-Reading Volumetric and Velocity Meter for Measuring Fluid Flow

In a meter for fluid measurements which is now being introduced, the meter chamber is divided into a series of compartments by means of vanes or blades on a revolving drum, and the volume and velocity of flow are determined by recording the number of compartments passing the discharge port. The revolutions are recorded on a register which gives direct readings of the volume and velocity.

The fluid entering from the pipe connection passes through a screen chamber (packed with sponge or other material suitable for arresting solid matter), and then enters the meter chamber through a port in the end wall. This chamber is elliptical in form and within it revolves a drum to which are attached hinged vanes, which are held out in contact with the side of the chamber by springs as well as by centrifugal force. The pressure of the fluid against the vane beyond the inlet port forces the drum to revolve, and when the next vane passes the port a definite volume of the fluid is isolated between the two vanes. As the first vane reaches the enlarged section of the chamber at the outlet end, the fluid escapes through the discharge pipe. A counter on the spindle of the drum is graduated to give a direct reading in cubic feet (or other volumetric measurement). The accuracy is claimed to be within 0.25%.

The chamber and springs are of phosphor bronze, and the vanes of hard brass. There is very little wear of the contact surfaces as the difference in pressure on opposite sides of the vanes is very slight. In the meter with 1-in. pipe connection, the chamber has diameters of 7½ and 7 in. on the major and minor axes, and is 2½ in. wide, while the size of the meter over all is 15½x9x9 in. At present the meters are made in sizes of ½-in. to 2-in. but larger sizes have been designed, including an oil-pipe-line meter to be put on a 48-in. main. They have been applied mainly for metering of compressed air, but are suitable for any fluid or liquid, and a modified design has been prepared for use with high-pressure steam. One field of application is on the pipes of oil-tank steamers. The amount delivered on board is measured and recorded, and the consumer can see that this same amount is passed through the meter in being pumped from the vessel to the tanks.



THE KREUZBERG DIRECT-READING VOLUMETRIC AND VELOCITY METER WITH END PLATE REMOVED

Several railways and factories are said to be using the meter on compressed-air piping to determine the proportions of the total supply that are delivered to different departments, so that proper charges can be made against these departments. Compressed-air tool companies also are using them to test the consumption of air by tools of different kinds or sizes or to test the consumption of a tool when new and after a period of service. In this latter case, if the consumption has increased excessively, the tool may be subject to inspection to determine where the leakage occurs and how this can be reduced so that the tool will retain its original efficiency for a longer period. Further, tools may be tested periodically, and sent to the toolroom for repair when they show an excessive consumption of air.

The device is known as the Kreuzberg volumetric and velocity meter, and is being introduced by J. S. McChesney & Co., 139 No. Clark St., Chicago.

A Toll Road of Concrete for use by automobiles is projected by the Texas Concrete Motor Highway Co. of Austin, Tex. The company proposes to build a network of concrete toll roads in Texas and estimates the average cost of construction at $20,000 per mile. It plans for the sale of toll privileges to automobile owners at the rate of $50 per year, and estimates that an average toll rate of 1c. per mile would be sufficient to make the enterprise a paying one. The reduced cost of fuel on such a smooth roadway compared with the power required to drive a machine over the ordinary dirt roads, with the reduced wear on tires, would make the patronage of the road an economy for automobile owners. Inasmuch as the only traffic over the road would be rubber-tired vehicles, with no wear from steel tires or horses' hoofs, it is claimed that the cost of maintenance of the road once well constructed would be practically nothing. A law passed by the Texas legislature in 1913 permits the organization of toll-road companies in Texas and gives them the right of eminent domain to secure their right-of-way. The general attorney for the company promoting this enterprise is Worth S. Ray, 601 Littlefield Bldg., Austin, Tex.

A New Flat-Slab Reinforced-Concrete Floor with Striking Features

The Harvard Avenue shops of the Cleveland Railway Co., Cleveland, Ohio, are being built with a rather remarkable reinforced-concrete floor construction, invented by David Morrow, of the firm of Morrow & Coss, civil and architectural engineers, Cleveland. The prominent feature of the Morrow floor is the arrangement of the columns in substantially equilateral-triangle grouping. This means, of course, that successive rows of columns are staggered, instead of being square and opposite, as in all other floor systems. Naturally corresponding to this column arrangement is the reinforcement of the floor. The bands of rods run in three directions 60° apart, crossing over the columns. The view in Fig. 1 and the plan in Fig. 2 show this very clearly.

Fig. 1. View of Reinforcement of Morrow Floor, Ready for Concreting

A second feature of the Morrow floor is the omission of any special secondary reinforcing means at the column head. Simple bar supports or formspacers carry the bands of rods and hold them up at the right level until the concrete incases them. The nature of the support will be seen from the sketch. Polygon rods are set on concrete blocks of such height as to bring the reinforcement into the top of the slab.

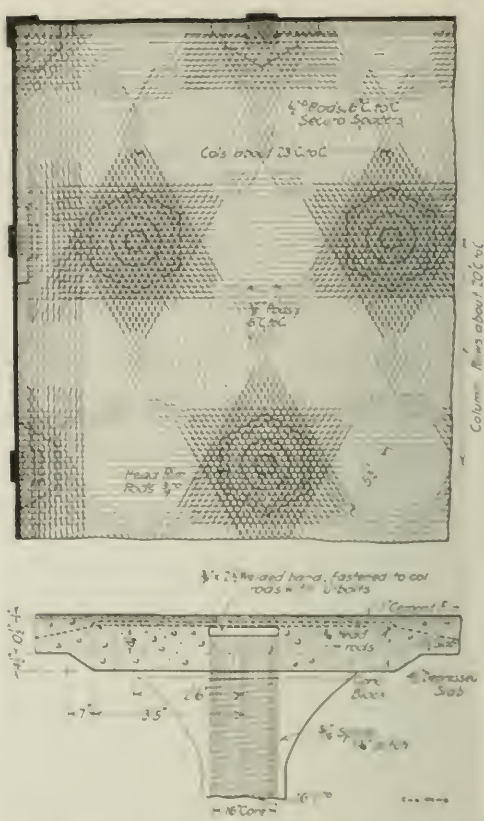


Fig. 2. Floor Used in Store Building at Harvard Ave. Shops of Cleveland Ry. Co.

(New floor invented by David Morrow)

Fig. 3. View Showing Staggered Column Arrangement of Morrow Floor

The inventor's leading idea in the arrangement of reinforcement appears to be that there is greater symmetry of the reinforcing metal, that is, a more equal distribution of the reinforcement in all directions from the column than in other systems. From this he concludes that the reinforcing metal can be placed in the slab more nearly in proportion to the stresses than other systems permit, which fact should mean economy. The Morrow patent is [illegible], dated June 17, 1913.

The buildings of the Harvard Avenue shops cover an area of about [illegible] acres and cost about $1,000,000. The Morrow slab is being used in the store building, 180 ft. by 126½ ft., in the 30,000-ft. floor over the basement of

the armature room, and over the 57x30½-ft. basement of the oil-storage building. Further, the roof over the 150,000-gal. fire-protection reservoir (55x32 ft. by 13 ft. deep) is of the Morrow system, and a similar reservoir (48x28 ft. by 11 ft. 3 in. high) is being built at Lake View Road and Superior Ave.

In constructing this reinforced work the rods were wired at all their intersections. This apparently tied them sufficiently to prevent chance displacement, as the runways for the concrete buggies were laid directly on the reinforcement, and often the buggies were turned out from the runways and run short distances to points of unloading directly on top of the reinforcing steel without disturbing the position of the bars.

Fundamental Planks in a Public-Utility Program*

By Delos F. Wilcox†

I have sometimes spoken of the relation between a city and its privately owned public utilities as an irrepressible conflict. The expressions "traction war," "gas fight," "telephone controversy," "electric light dispute," etc., are familiar to everyone. In the picturesque language of the newspaper and the street, public-service corporations have long been described as public enemies, and the attitude of belligerency toward them has become chronic in many, if not most, American cities.

While this antagonism often assumes exaggerated, unintelligent and even fantastic forms, and while there is a substantial community of interest along many lines between the public and the utility corporations, we must not blink the fact that there is a permanent and fundamental conflict of motives between them. No amount of regulation and no possible development of good will and the spirit of coöperation can change the fact that private corporations operating municipal utilities do so for profit and for as much profit as they can get, while the consumers and the public strive to get as much service as they can at the least possible cost.

The discussion of plans of campaign against high rates, poor service, political interference, financial tyranny and all the rest of the evils which we have set out to smite can only lead to confusion of counsels unless we clearly grasp certain underlying issues involved in the relations between the cities and the public utilities. Without having definite thoughts on these issues, we can not think straight on anything else, and without knowing what any particular speaker's thoughts upon them are, the rest of us can have no measure by which to gage the importance or fathom the meaning of what he says.

The underlying issues are:

(1) What shall be the recognized character of public-utility investments?

(2) What shall be the attitude of the city toward public utilities as money-earning enterprises?

(3) What attitude shall the cities take toward ultimate municipal ownership?

I shall answer categorically, according to my lights, the questions I have propounded under these three heads:

*Condensed from a paper read before the American Mayors' Conference on Public Policies as to Municipal Utilities, held at Philadelphia, Penn., Nov. 13 and 14, 1914.

†Consulting franchise and public-utility expert, 93 Nassau St., New York City.

(1) Character of the Investment

Public-utility investments should be placed upon a nonspeculative basis, and their security should approximate that of municipal bonds.

In the establishment of the nonspeculative character of these investments, *cities should not undertake to make good past losses.*

So far as future investments in the standard utilities are concerned, *the cities should assume the risks of loss due to unforeseen causes,* and should substantially guarantee the integrity of all investments made at the request or with the approval of public authority.

(2) Public Utilities as Money-Earning Enterprises

In my judgment, public utilities should not be regarded as a legitimate source of profit to be used for the relief of general taxation.

Compensation for franchise grants, and special taxes or license fees imposed upon public-service corporations should not be encouraged, unless the proceeds of such compensation or taxes are to be used in paying for the property.

Every individual public utility should be made to render a clear account of itself and, as a general rule, should be self-supporting.

Public-utility services should be rendered as nearly at cost as practicable, except that the rates should include a sufficient contribution to retire the investment within a definite period of time.

Public utilities should receive credit for all the service rendered by them to the city and its various departments, but only under unusual conditions should the city assume to subsidize a public-utility service out of the proceeds of taxation or otherwise.

(3) Ultimate Municipal Ownership

In my opinion, cities should *not* assume that public utilities are to remain permanently as private investments under private operation.

On the contrary, they should assume that all the well established utilities will sooner or later be publicly owned private capital being entirely excluded from the public streets except as it is loaned to the city.

In their franchise grants, and in all contracts affecting rates or granting privileges, the cities should establish the option to take over the utilities either at pleasure or at reasonable fixed intervals.

Wherever possible, the cities should go still further and without more delay definitely set in motion the machinery necessary to compel the gradual withdrawal of private capital from the public streets and the gradual acquisition of the utility plants by the cities as public property.

Subway Contracts in New York—The total contract price of the 64 subway sections on city owned lines already awarded is $146,253,346, of which $76,172,289 is on Interborough lines and $70,081,056 on the New York Municipal lines. In addition to these, the Interborough Rapid Transit Co. has under way third-tracking of the Manhattan and Bronx elevated lines, the first of which is estimated at from $8,000,000 to $10,000,000, and the New York Municipal Railway has under way elevated third-tracking and extension contracts involving an outlay of upward of $6,000,000, so that the grand total of work now going on in different parts of the city on the dual subway system involves an expenditure of about $152,000,000 contracted for on Dec. 1, 1914.

Field and Office

Methods of Filling and Dredging for a Jersey City Freight Terminal*

[illegible] dredging and filling operations on the Jersey City water-front at Communipaw, which have been in progress for the past [illegible] years, are now approaching completion. [illegible] made a freight terminal of the Central R.R. of New Jersey is being constructed. The filled-in strip is immediately back of the government bulkhead line, at which is being constructed a timber-crib bulkhead on hard-bottom foundation. It is built as the dredging and filling proceeds. The extent of the work is shown by Fig. 1.

Back in 1900, when the work was started, under permission granted by the War Department in 1898, the first operation was to float in a large number of old canal boats, fill them with stone and sink them from 400 to 500 ft. back of the bulkhead line. Just back of the canal boats an earth dike was made by unloading (by hand) cellar dirt from scows. The dike formed by the earth-backed canal boats prevented the new fill from being washed away by the tides. At various points back of this dike transverse dikes were built. Then the general filling-in operations began. These were carried on in four sections, three of which are about finished and the fourth under way at the present time.

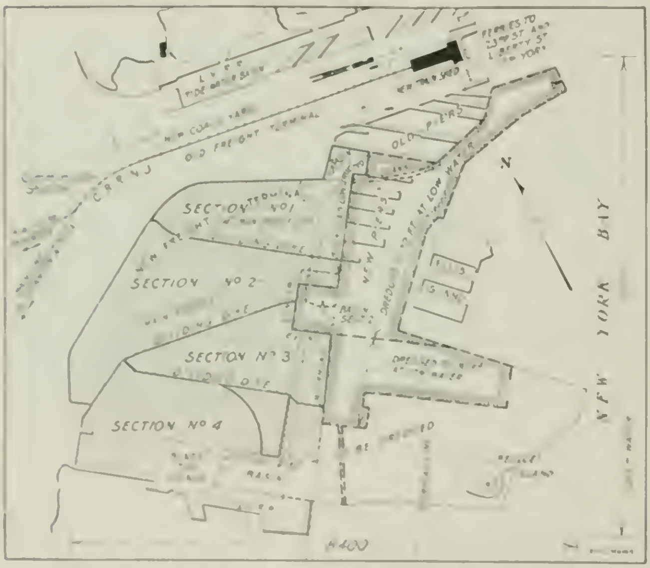

Fig. 1. [illegible] Map of Filled and Dredged Areas, Jersey City Freight Terminal

On section 1 and a part of 2 the general manner of conducting the work was to build trestling over the section, beginning at a basin dredged in the northeast corner of the section and connected to the bay by a channel. Mud and dirt brought in on scows were unloaded into cars on the trestle by clam-shell and orange-peel buckets on floating dredges, and the cars taken out on the trestling and dumped. When the fill was brought up above mean tide level, it was dressed with dirt.

[illegible] The work is at a distance [illegible] as the Tide-water Flats, and amounts to about [illegible] ft. of water front, averaging [illegible] ft. in width. On the ground thus [illegible]

Work on a section was carried on continuously, the material dredged outside the bulkhead line of each section was deposited inside the line. Section 1 was filled principally by the dump-car method described, but sections 2

*[illegible]

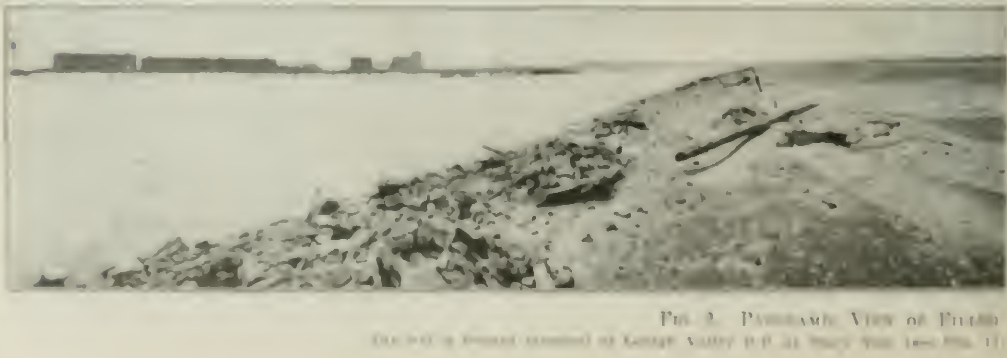

Fig. 2. Panoramic View of Filling

[illegible]

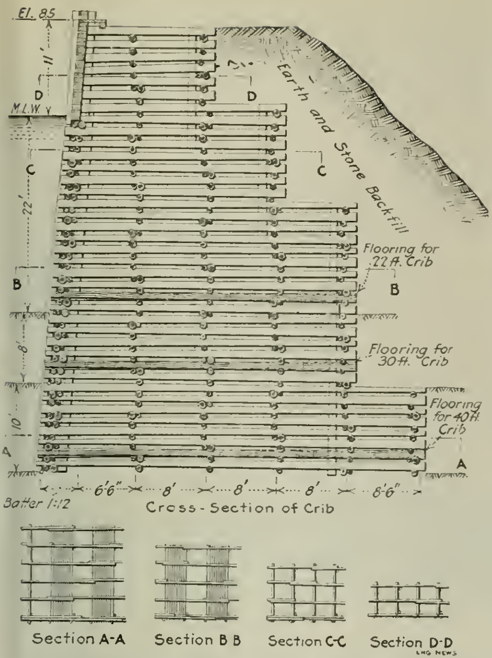

Fig. 3. Typical Sections of Large Timber Crib

and 3 were filled mainly by the action of large suction dredges. From the 800-hp. centrifugal pump of a dredge the discharge line was carried on pontoons to a pipe trestle extending out from the fill, thence over the made ground and discharged where desired, which was sometimes 6500 ft. distant from the dredge. As high as 190,000 cu.yd. of mud, sand and soft clay were put ashore in one month by one of these suction dredges.

The Dredging Plant

The powerful dredging plant consisted of as many as six units, working simultaneously on different classes of work. A suction dredge furnished hydraulic fill; a ladder dredge removed hardpan; two dipper dredges dug trench for the crib and removed hardpan, while two clam-shell bucket dredges unloaded material from scow to dump car, and placed fill immediately back of the bulkhead.

Hydraulic Filling—The suction dredges used are described as follows: Length, 160 ft.; width, 40 ft.; draft, 11 ft.; three boilers of 300 hp. each. The pump itself is 13 ft. high by 2 ft. 4 in. wide, and has a 5-bladed impeller which revolves at 350 to 400 r.p.m. The normal discharge pressure of the pump is 40 to 60 lb. per sq.in., and the diameter of the discharge pipe is 24 in. Solids amounted to about 5% of the total discharge, the water returning through a sluiceway.

The cutter consisted of a series of 6 heavy plates, each 6x1½ ft., varying in thickness from a cutting edge to 5 in., attached to a frame which revolves at 7 to 10 r.p.m. It is placed directly above the suction pipe and cuts the bottom so that the material can be taken up by the suction. An important feature of a fill thus made is that the harder and heavier materials are deposited at or near the point of discharge, so that by fanning the pipe line out in several directions a good, hard fill is left at the top, requiring no further dressing.

This plant was used on section 3. On section 2 the same method was employed, but the plant was not quite so large—an 18-in. discharge line was used.

Dredging Hardpan—In addition to the dredging of the materials used for the fill, a considerable amount of hardpan dredging and the removal of some rock were required in order to obtain the required depth of water. This hard dredging was accomplished by two kinds of plant: one, of two scoop or dipper dredges of 8 cu.yd. capacity each; the other the endless-chain bucket-conveyor dredge, with 29 buckets of ⅞ cu.yd. capacity each, as illustrated in A (Fig. 4).

This latter dredge is a familiar type in Europe, but is not used largely in the United States. The one used on this particular job has a 175-hp. boiler supplying two 150-hp. engines geared to the shaft which operates the buckets.

New Crib Bulkhead

When a section was filled from the main dike west, the permanent timber-crib bulkhead was built on the government line. The first step was to dig a trench down to hard bottom for the crib foundation. Accurate soundings were then taken to enable the crib builders to frame the crib sections, as the hard bottom ran as deep as 10 to 50 ft. below mean low water in some cases, while in others hardpan had to be removed. At other places where considerable inflow was expected in the trench, a rock fill was made as soon as the dredging was completed, and on it the cribwork was erected.

A cross-section of the crib is shown in Fig. 3. It is

Site of New Freight Terminal

at upper right is a dipper dredge digging trench for timber crib bulkhead)

formed by framing round logs together on the surface of the water, notching to fit and spiking them together. The crib was divided into square bays of about 9 ft. dimension, in which stone was dumped to give stability. After sinking and completing, the crib extended about 10 ft. above low water. The fill was even with the top.

SHORE BULKHEAD AND NEW PIER CONSTRUCTION

The land reclaimed to date comprises an area of about [illegible] acres filled to about 10 ft. above low water. The water in front of the improvement has a depth of 22 ft. at low water at its northerly half and will have, when completed, a depth of 30 ft. at low water at its southerly half. Material amounting to [illegible] cu.yd. of mud or silt, sand and clay has been put ashore by suction operations, and about [illegible] cu.yd. of hardpan, with

some rock, have been dredged and towed to sea. [illegible] lin.ft. of crib bulkhead have been built, and [illegible] lin.ft. are at present under contract.

In front of the area filled, [illegible] new piers have been built since 1907 with an aggregate length of [illegible] ft., giving a length of wharfage available for shipping of about [illegible] ft. Several more will be built in the near future.

The general construction of the open piers is creosoted piles on rock foundations, with [illegible] creosoted [illegible] decking. [illegible]

DREDGING.

The [illegible] Dredging Co. of New York has the general contract for the dredging and filling. The hydraulic dredge shown belongs to the Metropolitan Dredging Co., of New York. The work has been done for the Central R.R. Co. under the direction of Joseph O. Osgood, Chief Engineer, and A. E. Owen, Principal Assistant Engineer; C. M. Titsworth is Assistant Engineer in Charge of Construction.

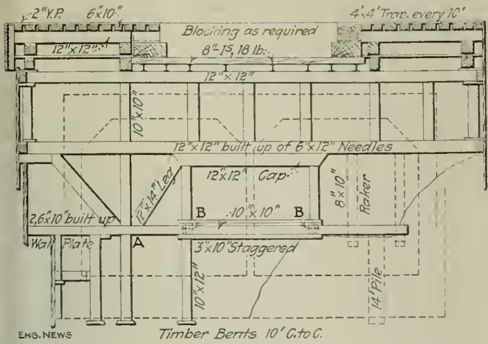
Special Subway Timbering on Section 1, Lexington Ave. Route, New York

A double method of support is employed for the timbering on the Broadway line, Morris to Dey St., of the Lexington Ave. subway, New York City. On this section, support has to be provided for both a double-track upper railway and an elevated line. The features of the special timbering are the continued arching and bracing secured and the use of a continuous girder throughout the length of the excavated section, supported on posts or fender piles.

Placing the timbers as shown in the diagrams practically insures the support of the whole structure from the two side posts at C, to which the load is transmitted. The continuous longitudinal girders B also afford redundant support which is not likely to be wholly destroyed even by the failure of several of the columns below. This design, it will be noted, provides for the entire support of the dense overhead traffic without the use of an excessive amount of timber and makes ample allowance for contingencies and the possible failure or permissible removal of one or more of the supporting posts or columns.



Special Subway Timbering on Section 1, Lexington Ave. Route, New York

Reference was made to this method of timbering by Fred Lavis in his seventh article on "New York Rapid Transit Railway Extensions," in Engineering News, Nov. 26, p. 1071.

Tamping Track with Air Power*

Pneumatic tamping of ballast under railway ties has been tried successfully on the River Division (West Shore) of the New York Central Lines. The tamper used in this work is very similar to a valveless hand-hammer or pneumatic drill, but fitted with a special tamping bar.

Tamping Outfit—A complete outfit or unit consists of two tie tampers and a portable gasoline-driven air-compressor, with 600 ft. of hose. The car which carries the compressor outfit is self-propelled and geared for a speed of 12 to 15 mi. per hr. It has space for a gang of 12 men, weighs 1700 lb., and can be removed from the track by four men in 45 sec. This quick handling is effected by the aid of a special derailing wheel at each end, these wheels being at right angles to the track.

Each tamping machine weighs 37½ lb. and can be manipulated by one man. It is provided with two spade handles placed at right angles to each other for easy handling. The air pressure is 80 lb. at the tamper and the consumption is about 20 cu.ft. of free air per minute.

In tamping a tie a pair of tampers is always used, one tool on each side of the tie, operating at an angle of about 15° toward each other. A tie can be tamped in two minutes. The tamping bar is curved to permit easy tamping under frogs and switches, and in other contracted places.

New York Central Test—The tamper was tested on a 1600-ft. section of track where new rail had been installed. Of this, 800 ft. were hand-tamped and 800 ft. tamped by the pneumatic tamper. This was done in 1913; after six months of heavy traffic the track was inspected, with the following results:

Greatest Settlement		Least Settlement		Average Settlement	
Hand	Machine	Hand	Machine	Hand	Machine
0.116 in.	0.063 in.	0.018 in.	0.004 in.	0.067 in.	0.033 in.

Cost of Operation—The cost per hour of operating a unit (compressor and two tampers), with gasoline at 20c. per gal. and gas-engine oil at 10c. per gal., was found to be: gasoline, 32.6c.; oil, 1c.; labor, 34c.; total, 67.6c. The average number of ties tamped per hour was 26, at a cost of 2.6c. each. The average number of ties tamped per day of 5½ hr. was 140. In this test the track was lifted from 2 to 4 in. G. W. Vaughan, Engineer of Maintenance-of-Way, under whose direction this test was carried out, believes that an average of 300 ties can be reached in a 10-hr. day.

The road now has 12 of these outfits in service. The pneumatic tampers and the compressors are manufactured by the Ingersoll-Rand Co., 11 Broadway, New York City.

*An electric tamping device invented by Mr. Collet, and used on the Paris, Lyons & Mediterranean Ry. (France), was described in "Engineering News," June 23, 1904. Each tamping bar was operated by a horizontal motor mounted on a pair of small wheels to ride on the rails, the two opposite motors being connected by a cross bar. An extension shaft from the motor drove the inclined tamping bar by gearing, the bar sliding in a guide fitted with cross handles held by the operator. Current was generated by a plant on a light motor car, and this car (like the gasoline car described above) had wheels at right angles to the rails to facilitate running it on and off the track as required. A light portable transmission line was used. The same equipment was used for driving screw spikes.

Fig. 2. A Track-Surfacing Gang; Compressor Car at Left

(Small transverse wheels are provided under the car so that it may be easily slid from the track on a temporary track of 2x4 scantlings.)

Fig. 1. A Tamping Unit in Action

A Water-Supply Main at Keyser, W. Va., was packed full for 50 ft. recently by roots from a single poplar tree. The pipe was a gravity supply main of vitrified tile with cemented joints, and had been laid for over twenty years. The roots nearly stopped the flow of water in the pipe.

around each rod, as shown. At two opposite corners are inserted the two halves of a split steel pile, the stems being held together by ¾-in. bent tie-rods. The steel sheeting engages with the projecting portions of the steel pile. In the center of the pile is a 6-in. pipe, and when the pile was in place a drill was dropped through it and a hole drilled into the rock. An old car axle was then

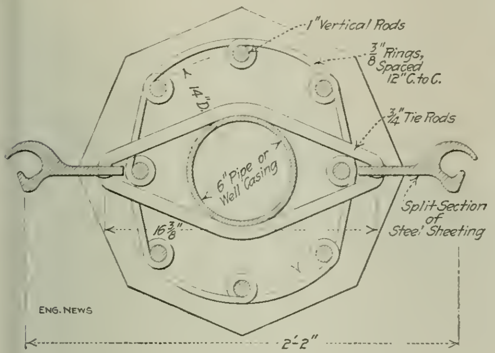

FIG. 1. SECTION OF REINFORCED-CONCRETE ANCHOR PILE USED IN A LINE OF STEEL SHEETING

dropped into the hole and grouted into the rock and the pile, thus anchoring the pile securely.

The construction of the dock is shown clearly in Fig. 2. The anchor piles are spaced 8 ft 9 in. c. to c., and at the center of each panel of steel sheeting is a horizontal anchor rod attached to the top of the sheeting and anchoring it to a concrete beam on the opposite side of the pier. Each of these anchors consists of a pair of 2-in. rods secured by washer plates to old rails at either end, and

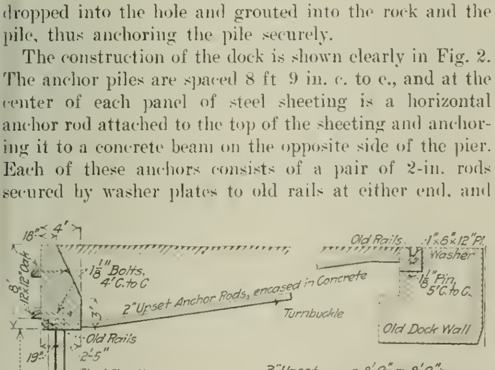

FIG. 2. PIER WALL CONSTRUCTION WITH STEEL SHEETING HELD IN PLACE BY CONCRETE ANCHOR PILES

the rods are incased in concrete for their entire length. This construction was designed and built by the Great Lakes Dredge & Dock Co., of Chicago, and has been used in the Black Rock harbor work at Buffalo, as well as at the Sandusky pier. For drawings we are indebted to the engineers of the Pennsylvania Lines.

A somewhat similar construction of pile, but intended to be used to form interlocking sheeting, was part of an alternative design for the new municipal pier at Chicago, but is not being used in the work now being constructed. As shown in ENGINEERING NEWS of Sept. 18, 1913, the pile was rectangular, 24x18 in., with half of a steel sheetpile embedded in each end, so as to make the piles interlocking. The socket part of the steel was flush with the face of the pile, so that the piles would be in close contact when driven.

A Small Incubator for Testing Water-Chlorination Results at Hudson Falls, N. Y.

By M. F. TIERNAN*

In connection with liquid-chlorine apparatus recently set up in three hours' time at Hudson Falls, N. Y., there was also supplied an incubator to enable the operator of the chlorine apparatus to make daily tests for the presence of B. coli in the raw and treated water.

A special incubator was devised for the purpose. It is 10x10x14 in. in size and is heated by two 16-cp. lamps. Bimetallic thermostats hold the temperature to within ½° C. The equipment also included two dozen 1-c.c. glass pipettes, a small sterilization case, one dozen ground stoppered bottles for samples and 100 lactose bile tubes. The glassware is sterilized by putting it in an ordinary basting pan in the oven.

The attendant was instructed to take samples of raw water and treated water in the sterilized bottles and then inoculate the bile tubes with 1 c.c. of the samples. They would then be incubated for 72 hr., which is the standard method for such work, and if B. coli were present there would be a formation of gas in the bile tubes.

Error or carelessness of any kind on the part of the attendant will be counted against him in the bacteriological results. If he should not have the glassware thoroughly sterilized or should be careless in taking samples or in making the inoculations, he will get results which will show. On the other hand, if the lactose tubes show no growth he can then be sure there are no B. coli present and that he has added the proper amount of chlorine.

We find that the water requires different amounts of chlorine at different times of the year for proper disinfection. Temperature, rains, and other meteorological conditions enter into the problem of water disinfection, and the whole thing centers in the question whether or not enough chlorine is added to destroy the B. coli.

The writer was gratified to find that the water-works officials entered into this scheme with enthusiasm, and is quite sure that they will give the chlorine apparatus careful attention when they can see for themselves the effect the chlorine treatment has upon the water.

NOTES

To Smooth Out Old Plans—When it is desired to flatten out old mounted plans, old paper drawings or old cloth or paper prints, the following method has been found to work successfully in every instance where harsh handling or reverse rolling would ruin the appearance of a drawing: Make a thick, boiled starch of flour by boiling flour and water down

What Is the "Cost" of Service by a Municipal Electric-Light Plant?

The interesting question has recently been answered by the Massachusetts Gas and Electric Light Commissioners as to what "price" a municipally owned utility could legally make to private customers and to the municipality itself. The statutes require that the minimum price to private consumers shall not be less than "cost," including interest on investment, maturing debt requirements, and depreciation. A maximum price is fixed at "cost" plus 8% profit, "cost" in both cases evidently meaning an average figure distributed over all the current generated, and neglecting well known differences in the actual cost of serving different classes of customers. Prices of less than this "cost," however, may be fixed with the consent of the Gas and Electric Light Commissioners. A municipality is to be "charged at cost" for all current supplied to it.

It appears that the municipal electric-light plant of Reading, Mass., had been operating with a small deficit each year in providing for operation, interest, maturing debt and depreciation, which deficit has been met out of the tax funds. Naturally, a sharp local controversy arose as to whether certain rates for private heat and power were not too low, or the supply to the town itself were not below the "cost" required to be charged by statute. The Board of Gas and Electric Light Commissioners, being asked to review the situation, approved the existing private rates although some are below the average cost of the governing statute. It held that these prices cover the various true cost items in fair proportion, and that accordingly the town is properly "charged at cost" for what it uses, so long as the direct appropriation plus the deficit met out of general funds keeps the plant solvent. As to how the various departments should handle their bookkeeping, the commission disclaims jurisdiction.

Well Deserved Support of the Coast and Geodetic Survey

The U. S. Coast and Geodetic Survey is the oldest scientific bureau of the government service, but there has long been an unfortunate lack of appreciation of the public importance of this bureau's work, and for many years it has been obliged to get along with inadequate appropriations and very defective plant. The Survey has now had the good fortune to find in Secretary of Commerce Redfield and President Wilson strong supporters of its work.

Secretary Redfield, in his annual report, just issued, and in recent public addresses, has shown the difficulties under which the officers and men of this bureau are attempting to accomplish their tasks. To take but one example: Secretary Redfield states that three of the vessels used in the Coast Survey work are, respectively, 38, 39 and 52 years old, one of them having been built as a Confederate gunboat in 1862 They are so unsafe and so unsanitary that if they were owned and operated by private parties the Government's Steamboat Inspection Service might well condemn them on the ground of public safety and public health. In fact, Secretary Redfield declares these ships are so bad that no private owner would use them, yet these are the vessels which the Survey has to use to carry on its work on the stormy and dangerous coast of Alaska. As for the buildings in which the Survey is housed in Washington, the walls of some of them, after being twice condemned by the District of Columbia authorities, were shored up to keep them from falling, and the Public Health Service has recently condemned them because of their unsanitary condition.

High commendation is given by Secretary Redfield to the wire-drag system of making soundings, which has been used by the Survey in recent years and is being extended as rapidly as funds are provided. In the eight years since the wire-drag surveys began on the Atlantic coast, 3300 rocks with less water over them than the charts showed have been discovered by this method. Nearly 900 of these were distinct menaces to navigation.

It seems to us that there is here an opportunity for the engineering profession to make itself heard in support of a government engineering bureau whose work in accurate mapping, precise leveling and the charting of the coasts of the United States is of immediate interest to engineers everywhere. Secretary Redfield's report makes clear that this bureau is hampered in the performance of its work for public safety by lack of sufficient appropriations. The engineering societies of the United States might well reinforce the recommendations of Secretary Redfield and President Wilson by the passage of suitable resolutions appealing for ample appropriations by Congress for this most important division of the government's engineering work.

Concrete Surface Finishes and the Test of Time

The early treatment of the surfaces of concrete structures, where there was any treatment at all, was consistently a mortar wash over the board-marked surface of the concrete. With few exceptions, this surface rapidly deteriorated. The light finish sloughed off and left scabby patches anything but pleasing. With the development of concrete work, an effort was made to procure for concrete surfaces some degree of artistic merit which would have for an important secondary consideration a good wearing quality. The primary consideration of an initially good appearance was satisfied by a number of different methods, but sufficient time has hardly elapsed to get much evidence as to the permanency and extended wearing qualities of these surfaces.

Recently, however, the observation of a number of concrete structures of approximately ten years of age

had impressed upon us the extremely successful wear of two particular types of surfaces, one a bushhammered surface crushed-granite concrete, and the other, the familiar so-called selected aggregate surface devised by H. H. Quimby when he was Engineer of Bridges of the City of Philadelphia, and applied by him to a number of the bridges in that city. All surfaces of the former type show that even after ten years of life the bush-hammered granite concrete has as sharp and sparkling a face as the day it was made, and compares favorably with the surface of a natural granite. Precisely the same may be said of the Quimby surface on the Philadelphia bridges. Contrasted with the frequently scabby, pitted or stained condition of the old smooth concrete surface, the selected aggregate surfaces of the Philadelphia bridges are quite remarkable.

It is probable that some of the other methods of treatment are equally successful and possibly somewhat cheaper, but these two particular methods have been brought so strikingly to our attention as to appear to us to be worthy of commendation.

Railways Which Ought Not to Have Been Built

We noted in our issue of Nov. 5 the impending abandonment of the Buffalo & Susquehanna Ry. in western New York, on which the traffic was no longer sufficient, in the opinion of the owners, to make it worth while to continue operations. Since then, announcement has been made that a railway line in Iowa of considerable local importance is to be abandoned for similar reasons, and that the residents along the line of the road are appealing to the State Railway Commission to compel the company to continue its operations. There are undoubtedly many hundreds or thousands of miles of railway lines in the United States which ought never to have been constructed. They were built either at a time when exaggerated ideas prevailed as to the prospects of profit in railway operation, or in the days when railway competition was active and the paralleling of existing railways was a recognized and fairly respectable industry.

It is not generally known, however, that similar conditions have prevailed in European countries, and notwithstanding the barriers which have existed there against the [illegible] of railway franchises. In the recent presidential address before the Institution of Civil Engineers, Benjamin Hall Blyth reviewed fifty years of railway construction in Scotland and gave some interesting illustrations of unprofitable railways which have been built in the Scotch Highlands.

The Invergarry & Fort Augustus Ry. was promoted in 1896. The line is [illegible] miles in length and was originally estimated to cost about [illegible], a little under [illegible] per mile. The actual cost, however, was nearly [illegible] of that sum. The company which built the railway leased it for operation, but there was so little traffic on the line that the leasing company finally refused to continue it and the road was for a time abandoned altogether. The local [illegible] finally secured the resumption of operations, and last year the company operating the road purchased it outright for [illegible], probably less than one-tenth of its original cost.

In 1897 three different companies appealed to Parliament for permission to build a railway from Fort Augustus to Inverness, about 31 miles, paralleling the Caledonia Canal. The estimated cost was from $1,800,000 to $2,700,000. All these bills were thrown out by Parliament. The district through which the line was projected is almost without population or production, and it is exceedingly doubtful now with motor cars available for land service and steamboats running on the Caledonia Canal whether the intervening gap between Fort Augustus and Inverness will ever be filled by a railway.

Another remarkable enterprise was the Paisley & Barrhead Ry. It was authorized by Parliament in 1897 and was finally completed and taken over by the Caledonian Ry. Co. From the day of its completion to the present not a single train has ever run over the line.

A Projected Concrete Toll Road for Automobiles in Texas

A century ago the building of toll roads by private companies was actively going on in many parts of the country. The coming of the railway diverted attention from highway construction, and after 1840 very few toll roads were constructed.

In recent years there has been a widespread movement for the condemnation and acquirement by the state of the few remaining toll roads owned by private companies. It is doubtful whether a toll road has been built in the United States in the last quarter century, unless such automobile speedways as the Long Island Motor Parkway, described in ENGINEERING NEWS, Sept. 17, 1914, be considered toll roads.

A project has just been launched in the State of Texas, under the authority of an act passed by the Texas legislature last year, for the building of concrete toll roads as a private enterprise. It may be of interest to discuss very briefly what are the general financial possibilities of such a scheme.

The cost of construction of such a road is estimated at $20,000 per mile. If we assume a width of 18 ft. and a cost of $1.25 per sq.yd. for the concrete paving, both of which figures should be adequate, this would give a cost of $13,200 per mile for the concrete alone, leaving $6800 per mile for right-of-way, grading, draining, fencing, bridging and all expenses in connection with the corporation. On the level plains of Texas and in a farming region where right-of-way could be secured at reasonable figures this allowance would seem to be sufficient. In fact, it would be possible, under favorable conditions, to considerably reduce the cost.

Interest on the investment of $20,000 per mile at 6% would amount to $1200 per mile of road per year. The promoters claim that the concrete road, once well built, would cost nothing for maintenance if it were used exclusively by automobiles with rubber tires. It will be admitted that the maintenance of the road surface should be very small under such conditions, especially in the Texas climate, where the temperature seldom falls very low and no trouble from frost attacking the foundations of the road need be feared. There would, however, be a certain expense for maintenance on other parts of the roadway, such as the bridges, ditches and other drains, the cutting weeds along the right-of-way, maintenance of fences, etc., and the wages of toll keepers. It would hardly be safe to figure on any smaller sum certainly than

$200 per mile per year. Some provision must be made also for a sinking fund to pay off eventually the bonds issued for the construction of the road, so if the road is to be a profitable commercial enterprise it must average earnings from tolls of at least $1500 per mile per annum.

The projectors of the Texas road propose a toll rate for automobiles of 1c. per mile and make the not unreasonable claim that an automobile owner will save at least 2c. per mile in gasoline, tires and general wear and tear on the machine, by running his car over a smooth concrete road compared with the ordinary Texas dirt road. They also propose a special tax on motor trucks according to the weight of freight carried.

It would seem not unreasonable to assume that an average toll rate of 2c. per mile on automobiles would be practicable, since a graduated tariff could be applied, charging a lower rate for the cheap small cars of the farmer and mechanic, and a considerably higher rate for the costly high-powered cars. The owners of the latter would be willing to pay a considerably higher price for the privilege of using a first-rate road.

If we assume an average toll rate of 2c. per mile, it would require an average traffic of 75,000 automobiles per annum to yield a revenue from tolls of $1500 per mile. This would be an average traffic of 206 cars per day, and if this traffic were evenly distributed throughout 12 hours of the day, it would be 17 cars per hour. Of course, there are many roads in the suburbs of large cities which have an automobile traffic very greatly in excess of this. Whether an average traffic of this amount could be counted on for an interurban road in Texas, such as is proposed by the promoters of the toll-road company above referred to, is a matter on which traffic counts in the locality should furnish fairly accurate information.

It will, of course, be apparent that such an enterprise would have far greater possibility of success in a state like Texas, where there are few roads outside of the cities which have paved surfaces of any sort. It must be borne in mind, also, that the use of automobiles is increasing to an amazing extent. The automobile registration in Texas in the years 1910 to 1913, inclusive, increased 452%, a greater percentage of increase than that of any other state of the Union except Kansas.

We are informed that the promoters of the Texas concrete toll road are reputable business men. The above analysis indicates that their project has at least a chance of yielding a return to those investing in it. It is to be hoped that the project may be carried into effect and that a practical demonstration may be given as to the possibilities of toll-road construction for automobile traffic.

A New Process for Improving Steel-Rail Manufacture

It has been known in railway circles for several months that the Lackawanna Steel Co. was developing a new process of treating steel rails during their manufacture, which it was claimed would effect a considerable improvement in the quality of the product. The company, however, has been hitherto unwilling to give out for publication any information concerning the nature of its new process. The first public statement concerning it is given in the paper by Capt. R. W. Hunt, just presented at the meeting of the American Society of Mechanical Engineers and printed in this issue.

The aim of the new process is to remove from the top and bottom surfaces of the billet which is ultimately to form the finished rail a skin of partially decarburized metal, containing blow holes and imperfections which were formed when the ingot was originally poured in the mold. These imperfections become longitudinal surface seams as the ingot is drawn down under the action of the rolls to a billet and finally to a finished rail.

The method by which this result is accomplished is something truly unique in mechanical engineering. The skin of metal is cut off the surface of the white-hot billet by a huge milling cutter running at a speed of 2500 ft. per minute, and cutting off metal at the rate of 500 to 800 cu.in. per minute. The removal of metal at this enormous rate is possible through the fact that the work is done upon metal so hot that it is in a plastic condition.

With the exception of the cutting-off saws in general use in rolling mills, there are very few cases that we recall where white-hot metal in a plastic condition has ever been subjected to cutting tools. From Captain Hunt's paper, however, it appears that the milling cutters used in the Lackawanna process are entirely durable, much more so in fact than they would be if used for cutting the metal cold.

Captain Hunt's commendation of the process is, of course, praise from a very high source. It will be evident that the new process has no effect on any interior defects in the ingot, such as piping or segregation, to which undoubtedly many rail fractures are traceable. There does seem good reason to believe, however, that the type of rail failures known as split heads and split flanges, which have been uncomfortably common in recent years, may be materially reduced, if not wholly eliminated, by the Lackawanna Steel Co.'s new process.

The Lesson of the Edison Fire

The disastrous fire which gutted a large part of Thomas A. Edison's manufacturing plant at West Orange, N. J., on December 9, was another of those catastrophes from which the engineering world increases its knowledge. The damage was so extensive and the clearing up since has been so active that it is difficult in the short time since the fire to get any account of the precise nature of the conflagration or any official statement of the losses, but an examination of the ruins is sufficient to make evident certain lessons that, doubtless, later thorough investigations will amplify.

First and foremost, the Edison fire emphasizes once again that most trite of fireproofing axioms—a nonburnable frame does not in itself constitute a fireproof building. To go to the expense of erecting many large and elaborate reinforced-concrete buildings, housing most inflammable materials and surrounded by wooden structures, and then to light those buildings with plain glass windows in wooden frames and to omit any automatic sprinkler or emergency water service can be excused only as an eccentricity of a genius whose transcendent ability in certain fields has in no wise made him omniscient. While the conflagration at its height was so severe as probably to make impotent all such precautions, a proper equipment with some such fundamental fire-protection appliances would have either prevented the initial spread of the fire or confined it to a comparatively limited area.

From a structural standpoint the lessons taught are

radically new. The gutted buildings in the plant demonstrate beyond contradiction that the column is the critical element in reinforced-concrete design. In every building, including those most seriously damaged, the remarkable toughness of the reinforced-concrete frame was evident. Totally stripped by fire of all contents, window frames and floor coverings, the naked concrete frame is standing, in every instance but one, with only minor cracks in beam and slab and hardly a perceptible sag or lean except where the columns have given way. In all but two of the reinforced-concrete buildings a superficial examination indicates that, after washing out with a hose and placing new window sash and glass, the buildings will be ready for installation of equipment.

In the remaining two buildings the trouble without exception lies in the columns, which have buckled and broken in an unprecedented manner. The immunity of certain columns and the destruction of others is not easy to explain, although the degree of heat and the application of water may be responsible, but those columns which have failed point decidedly to one conclusion—the straight-rodded reinforced-concrete column is dangerous in a hot fire. The views and description of the columns on another page of this issue will make every concrete designer pause and consider the possible ultimate economy, from a fire-resisting standpoint, of hooped reinforcement.

The Edison plant today is a field museum of reinforced concrete construction; it should be studied by everyone interested in the industry. Only after a thorough examination can a proper report be made on the conditions before and after the fire; and in the interest of good practice in concrete design, it is to be hoped that such study will be undertaken. Meanwhile, the observer must look at the wreck with mixed feelings: deep respect for the ability of the concrete frame to withstand the hard usage it received and wonder, not to say perplexity, at the manner of failure of some of the straight-rodded columns.

Letters to the Editor

The Low Headway on the New York Barge Canal as a Hindrance to Traffic

Sir—The writer accompanied the Atlantic Deeper Waterways Association on its excursion up the Hudson River on Sept. 25, and there for the first time learned that New York's new barge canal will have a clear headway of only 15½ ft. between the water surface and fixed bridges over it. This news gave the writer about as severe a shock as he ever experienced.

For years we have looked forward to the reopening of the modern Erie Canal, with the expectation that it would have some such favorable influence on transportation as the original Erie Canal in 1825. It was, therefore, a tremendous disappointment to learn how far below its anticipated effectiveness the Barge Canal would prove with its limitation of dimensions of vessels.

It was humiliating to hear the Governor of New York and other prominent speakers, during the progress of the excursion up the Hudson, give eloquent assurances as to what would follow the opening of the new canal, when big steamers from the head of the Lakes would traverse the canal from Buffalo to Troy and Albany, and after going down the Hudson, reach and load at other Atlantic seaports. In like manner we were treated to equally eloquent assurances that the vessels steaming up the Hudson would pass through the Erie Canal for delivery of return cargoes at various ports on the upper lakes.

Naturally, after my return to Philadelphia it was demonstrated to my satisfaction that such barges as for years have traversed the Chesapeake & Delaware Canal, the Lake Drummond Canal and the sounds of North Carolina, could not pass through the New York Barge Canal either light, loaded or partly loaded.

These barges carry loads of 675 long tons, drawing 8 ft., and 1000 tons at 10-ft. draft. The dimensions of these barges are substantially 210 ft. in length, 32 ft. in width, and measure from bottom of flat keel to the top of the pilot house: steel barge, 30 ft., and wooden barge, 32 ft. The wooden barge when light is 13½ ft. and when loaded 6½ ft. too high to clear the bridges.

During the past season steamers carrying 320,000 bushels or more of wheat have left Duluth, Fort William and Port Arthur, passed through the Soo Canals and unloaded their cargo destined to Montreal, at Owen or Parry Sounds, or Port Colborne, Canada. At Owen Sound and Parry Sound the transportation unit is reduced to 1500 bushel "carload units," and forwarded by railroads to Montreal. At Port Colborne the wheat is transferred to smaller steamers carrying, say 80,000 bushels wheat, which proceed through the Welland and Lachine Canals to Montreal.

The improvements under way at the Welland Canal, at an estimated expenditure of $50,000,000, to be supplemented by harbor improvements at Toronto costing probably $10,000,000 more, when completed, will still farther improve the Canadian export routes.

From May 1 to Nov. 28, 1914, there were exported from Montreal, 60,000,000 bushels of wheat, while during the same period New York exported only 20,000,000 bushels.

Prompt action would seem imperative upon the United States and New York State authorities, to rectify, so far as possible, the minimizing factor of insufficient height of fixed structures throughout the length of the new Barge Canal, as at present constructed.

FRANK L. NEALL,
Manager Philadelphia Transportation Bureau.
Bourse Building, Philadelphia, Dec. 6, 1914.

The New York Alien Labor Law

Sir—In an editorial in your issue of Dec. 3, referring to the New York Alien Labor Law, the general [illegible] that was that the law was not a good one.

I think you have overlooked the real intent of the law—that it is not its purpose to protect the public interest of New York, but to protect the interests of the American laborer, both skilled and unskilled. When aliens are entering the port of New York at the rate of a million a year, the enforcement of a law of this sort is necessary. Foreigners can get employment and live comfortably (according to their standards) when a native cannot live at all because his higher civilization exacts a higher standard of living. Under these conditions the American workman cannot survive—he simply disappears in the struggle for existence. No contractor can pay the American union rate without financial failure, where his competitors are paying aliens one-half to two-thirds as much. And with unrestricted immigration, this means that either our workman must be protected by legislation or else disappear from the industries.

To me it seems criminal to do anything in opposition to this law, which is only a last attempt on the part of the American workman to keep his footing in his own land.

A. W. Bedell.

Chappaqua, New York, Dec. 10, 1914.

[A careful rereading of the editorial referred to will show that we did not discuss in it the merits or demerits of the Alien Labor Law. The purport of our editorial was to show the enormous public loss which would result were there to be a wholesale annulment of the subway contracts because of past infractions of the law. We urged also that the status of the law should be promptly settled and it should then be either enforced or repealed.—Ed.]

Paint Protection of the Panama Canal Lockgates

Sir—My attention has been directed to an article in your issue of Nov. 26, on "Experience with Paint on the Panama Canal Lockgates," in which you refer to the poor results obtained with the paint applied to these gates.

It seems proper to point out that the unsatisfactory results mentioned in Col. Goethal's report refer entirely to the *exterior* surfaces of the gates, especially to that portion permanently under water. All *interior* surfaces, which comprise three-quarters of the total area, have remained perfectly protected, although in both the air and water chambers the conditions are rather more severe than on the outside of the gates. These surfaces were not painted in the usual manner, but were treated with a bituminous compound applied in a hot, molten condition to the clean metal.

Coatings of this kind, under the trade names of "Bitumastic" or "Bitulithic" enamels, have long been used in the bilges of war and merchant ships and have given excellent results in difficult locations where ordinary paints fail. It was, therefore, thought, although they are very expensive, that the use of such enamels would be fully justified for the interior compartments of the lockgates, which are dark and difficult of access so that proper inspection and repainting are not easy.

In accordance with the writer's recommendation, the contract for the construction of the gates provided that their entire interior should receive two coats of a bituminous compound of this kind.

Before the material left the contractor's works at Pittsburgh, all the surfaces were cleaned by a sandblast or by pickling, and those parts that would ultimately form the inner surfaces in the gates received a coat of bitumastic "solution" applied cold like any other paint. After the gates were fully erected in the locks, a second coat of the cold "solution" was applied, and before this had become thoroughly dry a heavy coating of the hot "enamel" $\frac{1}{16}$ to $\frac{1}{8}$ in. thick was finally brushed on. It is understood that up to the present time all these interior surfaces remain in perfect condition in both the air and water chambers.

At the time that the contract for the Panama Gates was let, it was feared that difficulties might be encountered in applying the hot coating successfully to the large exterior vertical surfaces on the gates. Experiments made under the writer's direction since then at Panama and also by others elsewhere lead him to believe that this fear was unwarranted and that it would have been better to treat the exterior surfaces in exactly the same way as the interior, or at least those parts of the outside which are permanently under water.

While they are probably too expensive for general use, it is believed that compounds of the character described above offer the best means now available for protecting metalwork under especially trying conditions.

The painting of lockgates to protect them from corrosion is a problem which has not yet been satisfactorily solved. It is important to secure good protection at all times without frequent repainting, as this interferes seriously with the operation of the locks, especially in warm climates, where the operation is continuous during the whole year.

Apparently, no one paint has given perfect satisfaction, as at different places various kinds are found in use. Thus, in the Naval Dockyard at Plymouth, England, the writer in 1908 found a preference for a coal-tar paint of simple character, applied in numerous very thin coats, while in the new docks at Bristol, only a few miles away, red lead was exclusively used. It is understood that in the Sault Ste. Marie locks, where steel gates have been in use since 1895, no one paint has been found entirely satisfactory, although many different kinds have been tried.

The conditions of the water in the Panama locks are especially severe, owing to the large amount of vegetable matters contained in the water, which generate sulphuretted hydrogen, carbonic acid gas, and various vegetable acids. The same conditions, perhaps to an even more marked degree, prevail in other tropical rivers, such as the rivers of British Guiana, where it has proved very difficult to protect ships' bottoms and other metalwork.

The writer has always felt that for such waters the selection of a satisfactory paint, which should not be too expensive, would require a rather long period of trial.

Henry Goldmark,

Late Designing Engineer, Panama Canal.

103 Park Ave., New York City, Dec. 7, 1914.

NOTES AND QUERIES

We published on p. 1160 of our issue of Dec. 10 reports of rail breakages on various railways. After that issue went to press we received additional figures from a railway company controlling 6000 miles of road. On this system during the 20 months from January, 1913, to August, 1914, there were 1891 broken rails and 17 train accidents caused by broken rails, of which 15 occurred during the winter months. Of the 1891 rails broken, 230 were 80-lb. and 1661 were 85-lb. rails

The Mechanical Elimination of Seams in Steel Rails and Other Steel Products*

By Robert W. Hunt†

No part of railway maintenance has been given more discussion and greater publicity than steel rails. The question of safety to human life and limb, to say nothing of property, is so dependent upon the quality of rails, that the reason for this publicity is easily understood.

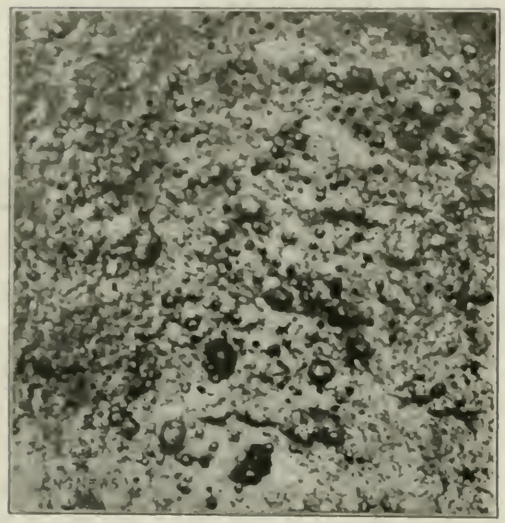

FIG. 1. PART OF THE FACE OF A STEEL INGOT, FULL SIZE, SHOWING SURFACE IMPERFECTIONS

Increased weight of rolling stock and speed of traffic have necessitated increasing the size of the rail sections, and hence their weight; and as many of the details of rail manufacture have been changed with such alterations, it is not surprising that new and unexpected physical weaknesses developed in the heavier rails. One of the most notable was failure through crescent-shaped pieces breaking out of the rail flanges, followed by at least one, and in many cases several, fractures across the whole section of the rail. Investigation showed that in practically every instance of such failure there was a more or less pronounced seam running longitudinally in the bottom of the rail near its center, and thus immediately under the web. This seam occurs at the top of the curve of the crescent-shaped break and is undoubtedly the point at which the fracture starts.

Those familiar with steel rail making know that it was practically impossible to make rails entirely free from seams, and that as the seamy condition of the steel forming the head of the rail increased, so would its wearing quality decrease, but I doubt if it was not until the [illegible] experience with the "crescent-shaped" failures that the danger from seams in the base of the rails was fully realized.

The crescent-shaped breaks were of such frequent occurrence that they led rail makers to experiment with the design of their rolling passes with a view to obviating the formation of the bottom seams. Fewer seams were produced as a result of such changes, but they were not entirely eliminated. While more or less successful in preventing the formation of seams through lapping on the bottom of the rails, the formation of seams in other parts of the section was not particularly affected.

It is a well known fact that it is not alone the quality of rails which deteriorates through the use of seamy steel, and the fundamental causes in one will more or less apply to all cases. T. H. Mathias, assistant general superintendent of the Lackawanna Steel Co., determined that the most certain way of getting rid of seams was to remove that portion of the metal which contained them, and, as applied to steel rails, thus to eliminate them from both the base and head of the rail. This was a reasonable assumption, but its execution, I think, would have seemed very impracticable to the minds of most metallurgical engineers.

Mr. Mathias reasoned that the primary causes of seams existed previous to any rolling of the steel, in fact, were incident to the casting of the molten metal into ingots. He knew that disk-like apertures were formed on the sides of ingots while the molten metal was being cast and were probably caused from air being entrapped against the sides of the ingot molds by the hot steel as it rises in the molds. This condition is illustrated by Fig. 1 which represents a section of the face of such an ingot, actual size, and illustrates how serious such apertures may be.

It will be appreciated that, as the section of the ingot

FIG. 2. CROSS-SECTION OF BAR FOR A STEEL RAIL POLISHED AND ETCHED TO SHOW LOW CARBON METAL ON EXTERIOR

is reduced and elongated in the rolling process, the apertures will be stretched longitudinally and thus be formed into seams.

Mr. Mathias further demonstrated that in the heating of large steel ingots a decarburized surface is formed on all of their four faces, about $\frac{1}{16}$ in. deep, and containing from eight to ten points lower carbon than the metal

*Abstract of a paper read at the annual meeting of the American Society of Mechanical Engineers.

†[illegible], Chicago, [illegible].

immediately under it, the decarburized envelope undoubtedly being produced through the oxidizing conditions to which ingots are subjected in the soaking pits where they are heated preparatory to rolling. A thick oxide scale is always formed on the surface of ingots in the pits, so that

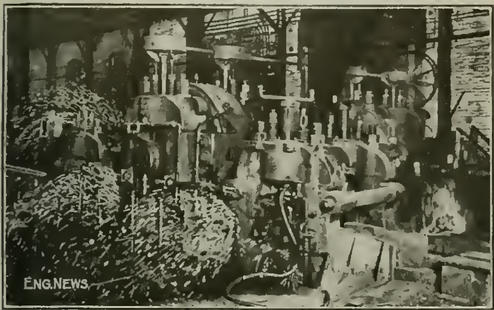

Fig. 3. Mathias Hot Saw in Lackawanna Rail Mills, Planing Metal from Top and Bottom of Rail Bloom

conditions are invariably present for the production of such a layer of lower-carbon metal on their outside faces. Fig. 2 illustrates the presence of this lower-carbon envelope or skin. It shows a polished and etched cross-section of a part of an ingot which has been heated to a rolling temperature in the soaking pits and has been reduced by five passes through the roughing rolls.

Mr. Mathias was convinced that during the process of rolling ingots into rails it was practical to remove mechanically the parts of the enveloping steel which would form the top of the head and bottom of the flange of the rail, and he experimented accordingly. He designed and his company installed as an addition to their rail train, a milling, or a hot sawing machine, as I believe Mr. Mathias designates it, to cut off this layer of lower-carbon metal without retarding the regular operation and thus interfering with the production of the mill. This is illustrated by Fig. 3, which is a photograph of the machine in operation. The machine is located in echelon in relation to the rest of the rail train.

The ingot is reduced in the blooming rolls to an 8x8-in. cross-section; and after cropping the ends, the bloom is further reduced in the roughing or shaping stand of rolls by five passes. When it leaves these rolls, it is approximately 75% finished, and at this period it is carried to the right and entered between two pinch rolls with its base or flange side up. A bar which will make four 33-ft. rails is at this point in the rolling operation about 60 ft. in length; therefore, the area of metal to be cut off or removed in the milling machine is approximately $\frac{1}{8}$ in. deep, 7 in. wide and 60 ft. long. It is driven through the pinch rolls at a rate of 60 ft. in 30 seconds. The pinch rolls have a draft of about $\frac{3}{8}$ in. and thus force the bar between the two milling saws, which are so arranged in the housing that they may be raised or lowered as desired. There is from $\frac{1}{32}$ to $\frac{3}{64}$ in. of metal milled from the head and base of the bar, the front end of which, immediately on passing from between the rolls, is caught by a second set of pinch rolls which have a draft of about $\frac{1}{16}$ in. These pinch rolls force the bar between the tools, pull it from between them, and also hold it in practically perfect line for the milling operation. The milling apparatus is driven electrically and requires about 600 hp. for its operation.

As the milled dust or particles of steel are thrown out, they are hit by water under pressure which forces them into a chute and also prevents the material from adhering together. By the chute they are carried below the mill and caught in boxes or receptacles suitable for charging as scrap into the openhearth furnaces.

Fig. 4 shows the accumulated material removed by the hot saw which, as will be seen, is in regular openhearth furnace charging boxes.

Fig. 5 shows one of the milling tools. It is 5 ft. in diameter with an 8-in. width of face and revolves at a peripheral speed of 2500 ft. per minute, thus causing an engagement of about 400,000 teeth per minute on the hot rail bar. The teeth are of 0.80 carbon steel, and it has been demonstrated that they will mill at least 30,000 tons of material without requiring dressing. The one shown had milled about 15,000 tons.

The work of rolling which the steel receives after the removal of the more or less laminated metal must produce a better product than if such elimination had not taken

Fig. 4. Steel Cuttings Removed by Hot Saw

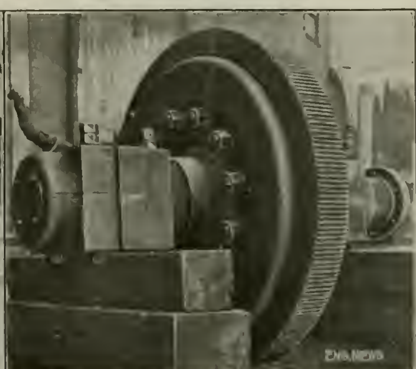

Fig. 5. Milling Cutter Used in Hot-Saw Machine

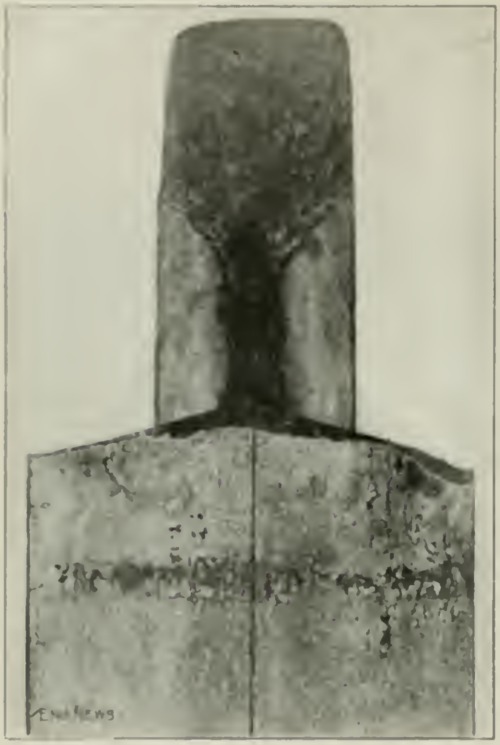

Fig. 6. Steel Rail Broken in Drop Test, Showing Longitudinal Seam in Center of Base

place, and, in the case of steel rails, it should not only make them less liable to breakage on account of seams in their flanges, but also enable them better to resist the abrasive effects of traffic.

During the many years of my connection with rail making I have examined a great many etched specimens of rails, not only directly in connection with the process under consideration, but for various other reasons. From such experience I can fully appreciate what Mr. Mathias has accomplished. The surfaces of practically all rails, when etched, will show some seams on both base and head, and very frequently the extent of such defects will not be appreciated if the scale has not been removed. Even then, it is not always an easy or certain matter to estimate the depth of the seams. When the rails have been subjected to the Mathias milling operation and still show pronounced seams, it has been found that breaking tests will practically always develop the fact that the suspicious marking is an actual seam.

Fig. 6, which is a piece of rail broken under the drop press, plainly shows a pronounced seam in its flange directly under the center of its base, and is an illustration of a dangerous rail. As the original defects on the sides of the ingots vary in extent, so will the character of the resulting seams vary and it can be readily appreciated that some of them may have been too deep to have been completely eliminated by the milling.

To illustrate the appearance of many ordinary steel rails, Fig. 7 shows the surfaces of both heads and flanges. These specimens were taken from rails made by several different makers, including the Lackawanna Steel Co. These illustrations not only clearly show the field for such an operation as I have described, but also the extent to which Mr. Mathias has been able to accomplish it.

While I have confined myself to the matter of steel rails, it is patent that the process will be of great value in

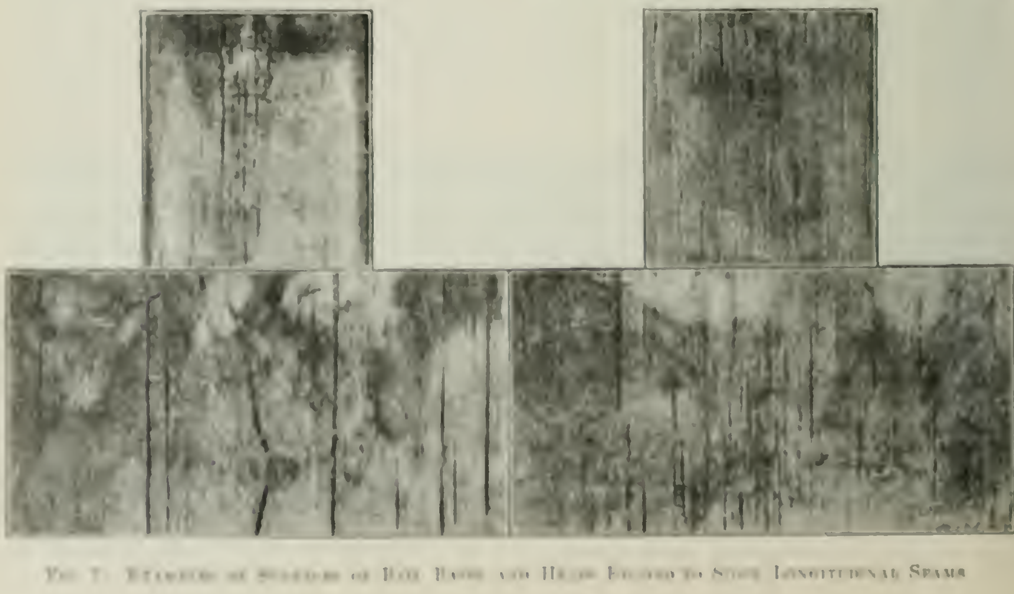

Fig. 7. Etchings of Surfaces of Rail Bases and Heads Etched to Show Longitudinal Seams

FIG. 8. SURFACE OF RAIL BASE AND HEAD TREATED BY LACKAWANNA DESEAMING PROCESS

the preparation of blooms for axles and all other kinds of forgings. As is well known, it is practically the universal custom to endeavor to remove the seams developed in rolling axle billets by chipping them out through the use of pneumatic hammers, and for some of the higher characters of forgings, notably for automobile parts, the endeavor to eliminate the seams is carried to the extent of turning off the whole surface of the billets. I am confident that by the Mathias plan the greater part, if not all, of such work can be superseded, and I regard the invention and its practical installation as a notable achievement in the art.

Flood Protection in China; Report of the Board of Engineers

The report of the Board of Engineers appointed by the American National Red Cross in May last to investigate projects for flood protection on the great plain of eastern China, has just been made public. In our issues of Sept. 25, 1913, and Feb. 12, 1914, we described the plans for control of the Huai River developed by Chas. D. Jameson, an American engineer long resident in China, and later the connection of the J. G. White Engineering Corporation with the project.

The report of the Board of Engineers just issued describes the unusual topographical conditions which have made the great plain of China at once one of the most fertile and densely populated regions on the face of the globe and likewise the greatest sufferer from alternate floods and drought. While the average annual rainfall over this area is approximately 36 in., it is subject to torrential rains of extraordinary severity. Local rainfalls of 25 in. in 48 hr. have been recorded, and storms of 4 to 8 in. in one to three days are quite frequent. The Huai River has not slope enough in crossing this plain to excavate for itself a deep channel, and it has in historic times frequently changed its course, thereby bringing calamity to millions of people.

The Board of Engineers in its report gives full credit to Mr. Jameson for the surveys and investigations carried on under his direction, but much more data are needed for the preparation of a final project. From such data as are now available, however, the Board is unable to recommend any of the projects heretofore suggested, and outlines instead a project of its own.

The Board's project involves the diversion of the Huai River where it enters Hungtse Lake and drainage of the bed of the latter, thereby reclaiming 400,000 acres of excellent land. The Board further proposes a system of control works and locks for the waterways affected, so that the channels it proposes to create and improve would be benefited for navigation and irrigation, as well as for flood prevention.

It is estimated that the entire work included in the Board's project would require the excavation of about 375,000,000 cu.yd. of material, or an amount 50% greater than the volume of excavation for the Panama Canal. The material to be excavated on the Chinese plain is nearly all earth, however, and the labor is phenomenally cheap. The total cost, including the proposed locks and controlling works, is estimated at $30,000,000. The direct benefits to the lands affected, estimated at over 7,000,000 acres, are appraised at $48,350,000. The members of the Board were Col. Wm. L. Sibert, Corps of Engineers, U. S. A., Prof. Daniel W. Mead, of the University of Wisconsin, and Arthur P. Davis, Chief Engineer of the U. S. Reclamation Service.

Annual Meeting of the Society of Naval Architects and Marine Engineers

The 22nd general meeting of the Society of Naval Architects and Marine Engineers was held at the Engineering Societies Building, New York City, Dec. 10-11. In the absence of Colonel Thompson, on account of illness, Stevenson Taylor read the presidential address. He called attention to the increase in the number of commercial seagoing vessels equipped with Diesel or other oil engines. The largest installation is 4000 hp. (six cylinders on each of two shafts), and more than 100 oil installations are in service at sea. Attention was directed also to the development in the geared-turbine system of propulsion. The number of such installations in service at present, or under way, is 126, amounting to 1,000,000 hp. During the past year 620,000 hp. in such turbines have been ordered. The submarine has undergone great development also. The modern type can steam at 20 knots on the surface and develop 5000 hp. with a combination of boilers, oil fuel and turbine-geared machinery. Storage batteries are employed for submerged driving. Several of the 14 interesting papers presented are abstracted below:

"Safety of Life from Fire at Sea," by W. O. Teague, listed a number of typical marine fires and their causes.

Means of [illegible] were then discussed, of which the two most important were the use of non-inflammable [illegible] in the construction of the vessel, and automatic sprinklers. The use of steam for extinguishing purposes has not [illegible] unqualified success. Tests have been made on shore where combustible materials were completely [illegible] although exposed to an atmosphere of steam. Furthermore, steam will [illegible] [illegible] water and is very powerful. Furthermore, as it is applied only to holds, it is at best only a partial [illegible].

[illegible] gases are good fire-extinguishing agents when the [illegible] is confined, but they are not as effective as water in absorbing heat, and have little cooling effect on the fire.

The use of carbon dioxide is objectionable since it [illegible]. A 10-lb. tube is required to each 1000 cu. ft. of air space. The gas is not injurious to [illegible].

Stress was laid upon the value of automatic sprinklers, whose application to vessels has only just begun. The estimated cost of a sprinkler equipment on shipboard, exclusive of pumps and tanks, is about $1 per sprinkler, these being spaced about 10 ft. apart, each one protecting 100 sq.ft.

"The Stability of Vessels as Affected by Damage Due to Collision," by William Gatewood, discussed the best design to give both stability and comfort. He stated that—

[illegible] prefer a vessel with a long period of roll, as the [illegible]. To obtain a long period, it is necessary to have a large vessel or a small metacentric height, and the combination of the two requisites in the large Atlantic liners renders travel on them a pleasure instead of a hardship to the [illegible] with a "[illegible]" stomach. [illegible] metacentric height [illegible] accompanied by a long [illegible] and a [illegible] range of stability, there is small danger of capsizing due to wind and wave when intact. The comfortable condition of a vessel, however, may be a source of great danger [illegible] if the vessel is damaged by collision.

"Refueling Warships at Sea," by Spencer Miller, interestingly described the gradual development of methods of getting coal and oil on board when at sea. The value of doing this [illegible] was illustrated by a number of instances in [illegible] operations during the present war. Attention was called to the record performance with the U. S. S. "Wyoming," coaled at Guantanamo Bay in the spring of 1913 from the U. S. colliers "[illegible]" on one side and the "[illegible]" on the other. In [illegible] hours 2000 tons of coal were taken on and stowed, an average of 21[illegible] tons per hour. The colliers rigged out eight booms over the deck of the "Wyoming" and discharged with clam-shell buckets.

The [illegible] at [illegible] the [illegible] of [illegible] ships in a seaway was fully described. The U. S. collier "Cyclops" illustrates the highest development in this direction. The [illegible] of this vessel is [illegible] of [illegible] automatic [illegible] [illegible]. [illegible] [illegible] the "[illegible]" in the [illegible] of the [illegible] cable produced a corresponding and [illegible] change in the [illegible] pressure. A [illegible] of the [illegible] cable [illegible] an [illegible] in the [illegible] sufficient to restore the tension to normal; while a [illegible] of the cable [illegible] an [illegible] in the [illegible] pressure, permitting the cable to pay out until the tension is restored to normal. This cableway has been tested in heavy seas, with the "Cyclops" rolling 20°. On another occasion coaling was carried on between the collier "Vestal" and the battleship "Virginia" in a dense fog, in which neither ship could see any part of the other.

"The Behavior of Riveted Joints under Stresses," by James E. Howard, called attention to the fact that few, if any, riveted structures are erected which are free locally from strains which exceed the elastic limit of the material. The structures are not necessarily endangered by the presence of these overstrains. It depends upon the character of the work which they have to perform, however, whether ultimate failure will result and the place of rupture be located by an overstrained zone. The strength of various kinds of riveted joints was then discussed.

"The Applicability of Electrical Propulsion to Battleships, together with the Experience Gained with it on the 'Jupiter,'" by Lieut. S. M. Robinson, U. S. N., was a paper whose presentation was awaited with great interest by the membership. The author stated that "I do not believe there is any question of the relative economy of the two methods—the electric drive is far superior. The 'Jupiter' was in commission over a year and a half, during which time two official trials were conducted, and the usual routine work of a navy collier carried on. She covered about 14,000 miles, and was handled around docks, in narrow channels, and in other places demanding flexibility of drive. About one-half of the steaming was done in the tropics, with circulating water over 80° F. and correspondingly poor vacuum, so that the economy of the ship is known under all conditions. The fuel economy was excellent, being on the average about 25% better than the best of her sister colliers."

The annual banquet was held in the Astor gallery at the Waldorf-Astoria, on Dec. 11. The attendance was about 260.

In the election of officers for the ensuing year, the following were elected vice-presidents: Rear-Admiral W. L. Capps, retired, W. L. Babcock, W. S. Durand, and D. W. Taylor. Members of the Council elected were: J. J. [illegible], D. H. Cox, H. L. Ferguson, C. H. Peabody, E. L. DeBaque, H. C. Sadler, H. S. [illegible], and H. L. Aldrich. D. H. Cox was re-elected Secretary.

Sewers as Obstructions to the Chicago River [illegible]

[illegible]

The Fire in the Edison Works at West Orange, N. J.

During the night of Dec. 9, 1914, fire in the main plant of Thomas A. Edison, Inc., and associated companies at West Orange, N. J., very seriously damaged eleven buildings and burned over an area of nearly 6 acres in which these and other buildings were located. Estimates of loss run all the way from $750,000 to $3,000,000, the correct figure being largely dependent on the amount of reclamation of machinery and structure. Outside insurance was held to the amount of about $200,000. Only one person was killed, although a number of work people had to get out of the plant after the fire started and men were engaged all during the fire saving equipment and products.

FIG. 1. LOOKING SOUTHEAST OVER THE BURNED AREA OF THE EDISON PLANT WHERE THE FIRE STARTED
(Concrete building in left background is the phonograph building, where the columns, shown in Fig. 3, were all shivered.)

The plant comprised a great number of closely spaced buildings, separated by narrow interior streets and alleys and by the wider streets of the city. Structural design varied with the age of the buildings. The earlier buildings were one- and two-story structures with brick walls and timber floors, and in one or two cases steel roof trusses. About seven years ago reinforced-concrete buildings were started and this type of construction has been followed since.

The fire started in one of the low brick and timber buildings, probably from an explosion or rapid combustion of some of the elements of moving-picture film manufacture, and rapidly spread to the immediately adjacent low brick shops and storage houses. The contents of these proved such effective fuel that the fire soon spread into and through the reinforced-concrete buildings which housed film stock, phonograph cases, phonograph disks and cylinders, packing boxes and office records, all except the latter being highly inflammable. The fire started at 5:30 p.m. and was fought all through the night by the united fire departments of West Orange and the surrounding communities, but with the exception of the saving of the famous Edison laboratory (brick and timber buildings) and one concrete building alongside, all that the firemen could do was to prevent the fire from jumping a city street to the newest concrete buildings of the plant, those used for storage-battery manufacture. The fire was thus confined to buildings in a city block. It was not under control until the early morning of Dec. 10.

Water supply, practically entirely from the city service, was low in amount and pressure, though the severity of the fire and rapidity of its spread were such that probably this inadequacy had no effect on the final result. Of the entire plant only the laboratories were equipped with sprinklers, and the fire never came near enough to them to require the sprinkler service.

The reinforced-concrete buildings varied in height from four to seven stories and were all, with one exception, of the same general type, though varying somewhat in design and layout. In general, they had beam-and-slab floors spanning square, straight-rodded columns, with fascia wall girders holding wooden window frames with plain-glass lights. The exception was one of the older buildings, which had, for the lower floors at least, hooped round reinforced-concrete columns. The ends of some of the concrete buildings nearest the low brick buildings had concrete curtain walls instead of windows.

The effect of the fire on the brick and timber buildings has nothing of novelty; the view in Fig. 1, overlooking the site of the initial fire, shows the complete destruction wrought

The effect on the concrete buildings, on the other hand, is interesting in the extreme. Every concrete building

Fig. 2. The Third Floor of the [illegible] Record Building
(The outside of this building is shown in Fig. [illegible])

Fig. 3. Interior of the Phonograph Storage Building, Showing Column Destruction
(This building is the one shown in the left background of Fig. 1.)

Fig. 4. The Only Collapse in the Edison Fire

(Heavy machinery was stored on the upper two floors.)

Figs. 5 and 6. Further Examples of Interior Column Failure

Fig. 2. Reinforced-Concrete Columns Destroyed by Fire at the Edison Plant

[illegible] was gutted of contents. The fire readily broke through the glass windows and, aided by the inflammable contents and wooden trim, soon destroyed everything except the concrete frame. The view in Fig. 1 shows the extent of this damage in two of the buildings, a condition practically duplicated in all the rest. Counting certain wings as separate structures, there were seven large buildings thus affected.

In most of the concrete buildings the concrete has stood up remarkably well. With machines reduced to scrap and [illegible] with the floors [illegible] burnt phonograph records, and with the wooden sleepers burned out from their grooves in the concrete floor, the concrete itself is remarkably free from cracks and spalls. In two of the buildings, however, the destruction of concrete, particularly of the columns, is more serious than has ever before been noted in concrete buildings under fire.

The views of Figs. 2, 4-8 show the conditions in these buildings. It will be noted that the common type of failure is in the straight-rodded column and its progression can be shown in different columns in the figures. Evidently the action is as follows: Under the heat of the fire the longitudinal steel rods (which were only at the four corners and evidently not tied horizontally) expand, and in expanding throw off the outside coating of concrete. Once exposed, they are free to expand further and, in their softened condition, to bend under load until finally the weakened section of concrete crushes under the load, the column drops and the rods bow out almost in a loop. Fig. 5, a view in the first floor of the phonograph warehouse, where the packed machines made a very hot fire, shows the secondary stage in this failure. Practically every column in this building is shattered seriously at the reinforcing rods and many are reduced in section or broken. The whole seven-story building is still standing on columns which can hardly have 50% of their original section.

The views in Figs. 3 and 8 show the third floor of the phonograph-cylinder shop, a floor on which were thousands

Fig. 3. Outside of [illegible] Building, Showing Third-Floor Columns Destroyed

[illegible]

of the wax dictating records and which was subjected to the hottest kind of a fire. It is evident that concrete heated almost to incandescence is much more apt to break down and spall if wet down than if left to cool naturally. This may account for the condition of the columns on this third floor. The fire here was much hotter than on the other floors of the same building and was the main point of attack of the engines, which were able to take a near-by stand for a time at least. The third-floor columns are in the last stage of failure and have dropped from one to two feet, carrying the floors in a sag, but in no case causing total collapse. The remaining floors of the building are remarkably free from cracks and breaks.

The hooped columns were in the building where were stored undeveloped moving-picture films and which was burned out. The precise nature of their design is not now available, but the one column that is stripped in one small patch shows a heavy expanded-metal cylindrical covering. All the columns on the floor are practically intact.

In many of the views cracks in the beams and girders may be noted. In every case these are over reinforcement, which has expanded as in the columns, and forced off the concrete covering. The depth of this covering varies, but in most cases it is equal to or greater than the 2 in. required in modern practice.

At one point only were the column failures of sufficient extent to cause collapse, and that was at the corner of the upper floors of a six-story factory, on which floors heavy machinery was located. The collapse is shown in Fig. 4. It is rumored that the largest explosion of the night took place at this point and caused the collapse, but it appears that the failure of some corner columns was the initial cause. The behavior of the lower floors and of the adjoining building in standing up under this heavy impact testifies to the integrity of the structure against mere load conditions.

At the present stage of investigations there is no definite record of differences of age or peculiarities of material, design or temperature conditions during the fire which might cause the different effects on the various buildings. To a somewhat superficial examination, the structure in all of the buildings is equally good; the concrete seems to be admirable. How far the peculiar fire or explosion conditions resulting from the permeating volatile oils which were present in the plant are responsible for damage is also a matter that may be cleared up in the thorough investigation which it is hoped may soon be under way.

NEWS NOTES

A High Wind Lifted a Steel Stack at the Flatbush Waterworks, Brooklyn, N. Y., and carried it 50 ft. through the air, dropping it through the roof of a house, where it fell through the ceiling into the room below, on Dec. 8. No one was hurt. The stack spent the night in the house. The next morning derricks were placed for its removal.

An Acetylene Tank Exploded in a junk yard at Hagerstown, Md., on Dec. 5. The gas was used in the cutting of scrap iron. The tank exploded when a match was applied to the end of the tube leading from it. One man was killed and another injured.

A Pipe Plant Burned in Birmingham, Ala., on Dec. 6, belonging to the Southern Sewer Pipe Co. The main building, 500x80 ft., three stories high, of brick and wood, was destroyed. The total damage was estimated at $100,000. The manager stated that the plant would be rebuilt

Collisions on Elevated Railways, New York—On Dec. 9 a local northbound train on the Ninth Ave. Elevated Ry. crashed into the rear of an express train standing at a station. Two persons were killed and 18 injured. Preliminary investigation by the Public Service Commission developed the fact that the local was being operated from the fourth car, on account of derangement of the electric control machinery in the first car. The motorman depended for guidance upon signals given him by a conductor stationed on the rear platform of the first car. This car telescoped the rear car of the express train and both took fire from the third rail and were consumed. A public inquiry into the accident was scheduled for Dec. 16 by the Public Service Commission. On Dec. 11 a local southbound Sixth Ave. train struck the rear of a Ninth Ave. local standing at 150th St. Seven persons were injured. The motorman was driving from the first car. He is reported to have stated that he did not see that the train ahead had stopped, until it was too late to avoid collision.

Macadam Pavements Have Been Laid in Winnipeg, Man., since 1894, to a total of nearly 600,000 sq.yd. Since 1901 nearly 165,000 sq.yd. have had to be removed.

The Field Work of the Topographical Survey of Ohio has been about completed by the United States Geological Survey. It is expected that all the sheets not yet published will be available within two years.

The Proposed Freight Terminal of the Lehigh Valley R.R. at Buffalo, N. Y., requires the demolition of 30 buildings on the ¼-mile square, recently purchased by the railway for $1,200,000. Most of the buildings are small frame stores and dwellings, and their demolition is under way at the present time.

A Bill for Licensing Engineers is, according to report, again to be introduced in the New York legislature, which assembles on Jan. 1. The bill originates with the Technical League of New York, and it is supposed will follow generally the lines of the bills pushed by that organization in previous years.

The U. S. Steamboat Inspection Service in the year ending June 30, 1914, inspected 7930 vessels, with a gross tonnage of nearly 10,000,000. There were 232 accidents during the year on vessels subject to inspection, resulting in a loss of 105 passengers and 477 members of the crew. One passenger was lost for each 3,029,000 passengers carried. The report recommends legislation to require fireproof construction on all excursion steamers hereafter built, and that the designs for the hulls and boilers of all vessels hereafter built should be first examined and approved by a corps of inspectors in the office of the supervising inspector general.

3512 Men on Panama-Pacific Exposition Construction—A census of employees of the Panama-Pacific Exposition on Nov. 1, showed a total of 3512 men engaged on construction work. This force was distributed as follows:

Exposition board of works, engaged on main buildings	723
State and foreign buildings	1060
Concessions	663
Exhibits	96
Office force	298
Landscape gardeners	99
Firemen	74
Sculptors	40
Clearing grounds	339
Guards	120

The Standard Form of Building Contract adopted by the American Institute of Architects is in process of revision by a committee of the Institute in coöperation with a committee of the National Association of Builders Exchanges. At a joint meeting in Philadelphia in September last, a preliminary draft of the revised form was prepared, and this revised form has now been printed for further discussion at the annual meeting of the American Institute of Architects to be held in Washington this month. Copies of the revised draft can be obtained from the General Commissioner of the Builders' Exchanges Association, Mr. I. H. Stales, 15 East Fayette St Baltimore, Md.

A Municipal Refuse-Utilization Plant is being built by Columbus, Ohio. The salable refuse will be picked from an inclined conveyor belt and baled. The tailings will be burned in a two-cell Stirling furnace, built by the Griscom & Russell Co., New York City. The cells will have a rated capacity of about 45 tons a day. Steam generated by a 150-hp. boiler will be utilized at the near-by municipal electric-lighting plant. T. D. Banks is Superintendent of Garbage Reduction and Refuse Disposal at Columbus. The plans for the refuse-utilization plant were originally made by Ira S. Osborn, but have been remodeled somewhat by J. J. Morgan, Commercial Building, Columbus. The abandoned West Side pumping station is being remodeled to house the refuse-utilization plant.

To Provide for Unemployed Men in Los Angeles County [illegible] the board of supervisors has authorized road work [illegible] will [illegible] arrangements are under way [illegible] work [illegible] men. In the [illegible] who have lived in Los Angeles County one year will be given preference.

The Chicago River Protective Association has been organized by a group of [illegible] owners. Its purposes are to promote the [illegible] of the river and prevent its further obstruction, to secure the removal of the center-pier swing bridges and other obstructions, to secure a width of [illegible] ft. and a depth [illegible] for modern commerce, and to aid in [illegible] a [illegible] for the solution of the drainage problem of Chicago. [illegible] W. [illegible] is chairman of the association.

Better State Highway Legislation is the object of a committee to work for revision of state road laws appointed by the directors of the American Highway Association on Dec. 1. The committee consists of Walton Moore, of Washington; Chas. J. Bennett, State Highway Commissioner of Connecticut; A. N. Johnson, Chief Engineer, Bureau of Municipal Research, New York City; Francis J. Caffey, of the Department of Agriculture, and J. E. Pennybacker, Chief of Road [illegible], U. S. Office of Public Roads.

Adequate Survey of Pacific Needed—In his annual report [illegible] on Nov. 22, Secretary of Commerce Redfield emphasized the need of legislation and money for the protection of [illegible] and safeguarding vessels against needless destruction. The immediate need for three vessels for survey work along the Alaskan coast was pointed out. He said "Our [illegible] have been drowned (31 in one case), and both private and public property repeatedly lost, because the United States Government has not more rapidly provided the force and apparatus with which to survey and chart the dangerous waters of our Pacific and particularly of our Alaskan coasts."

Geared Steam Turbines for ocean steamship propulsion have been adopted on the "Transylvania," the new Cunard transatlantic steamship of 1[illegible] tons which arrived in New York Nov. 17. According to "The Engineer" of London the propelling machinery of the vessel consists of two sets of Parsons steam turbines, the high-and low-pressure drums being on separate shafts. Each turbine shaft carries a helical spur gear in mesh with a gear wheel on a propeller shaft. The gear reduction is 12½ to 1, and the propeller shafts are [illegible] at [illegible] revolutions. With both sets of turbines developing 9[illegible] hp. it is expected to give the ship a speed of 15½ knots.

The Building of Wooden Passenger Cars has ceased in the United States. The report of the Committee on Rails and Equipment to the National Convention of State Railway Commissioners in Washington last week showed that of 31[illegible] passenger train cars under construction on Jan. 1 last [illegible] were of steel, [illegible] had steel under frames, and only [illegible] were of wood. Only two of these were intended for the use of passengers. The number of steel and steel under-frame passenger cars in service on Jan. 1 was about [illegible] and the number of wooden cars about [illegible]. It is also becoming common to use steel cars for cars having [illegible] frames and wooden upper construction.

A River Straightening Job at Dayton, Ohio, part of a larger scheme which had been planned before the great flood of 1913, has been completed under the direction of the Public Service Department of the city. [illegible]

Fast Third Tracking on Second Ave. Elevated Ry., New York—[illegible]

Changes in Lime Handling at the Cincinnati Water Filtration Plant [illegible]

[illegible] received in cotton duck sacks, each holding 1[illegible]0 lb. It is now bought in bulk in carload lots and passed through a swing-hammer crusher, direct connected to, and driven by, a [illegible]-hp. [illegible]-volt, direct-current electric motor. The lime is [illegible] from railway cars to the hopper of the crusher. The crushed lime is discharged into the boot of an elevator and carried to the second floor of the chemical house of the filtration plant, where it is dropped into a drag conveyor hung from the ceiling of the [illegible]-house roof. The valves in the bottom of the conveyor drop the lime into a room which has been partitioned off in the chemical house by corrugated iron. The elevator and conveyor are operated by a [illegible]-hp. motor. These improvements cost about $2[illegible]. The new method of handling lime will save at least [illegible] per ton and perhaps more on the cost of the lime alone, besides a saving in freight for the return of empty sacks to the kilns to be refilled. The cost of the labor for unloading will also be less. Altogether the annual saving will probably be about $[illegible] a year. J. W. [illegible] is Superintendent of the Cincinnati Filtration Plant, and J. A. Heller is General Superintendent of the Cincinnati Water-Works.

The Centennial Anniversary of the Steam Printing Press has just occurred. On Nov. 29, 1814, the issue of "The Times" of London, England, was for the first time printed by steam power. The machine used was a cylinder printing press, also the first of its kind ever produced. A full description is given in the "Times" Engineering Supplement of Nov. 27, 1914. This steam press was invented by Friedrich Konig, a native of Eisleben, Saxony, the birthplace of Martin Luther. Konig was a printer's apprentice at Leipzig and after making various inventions which found little appreciation in his native country, he emigrated to England in 1806 and obtained the financial assistance of Thomas Bensley, a printer. The general principle of the cylinder press had been developed by an English inventor, William Nicholson, in a patent dated 1790, but Nicholson was without means and was in fact found by Konig in a debtor's prison. Konig's designs, which he patented in 1811, were taken up by John Walter, the head of the London "Times," and after three years of patient labor the first cylinder press driven by steam power was completed. This machine printed one side of a sheet at the rate of 11[illegible] copies an hour, and was later improved to reach 1[illegible] copies an hour. Three years later the machine was improved by Konig to print on both sides of the sheet.

A New Railway Route between the Northwest and the Gulf ports has been established by the completion of the Chicago, Burlington & Quincy R.R. extension from Casper to Orrin Junction, Wyo., about [illegible] miles. This completes a low-grade line from Billings, Mont. (on the Northern Pacific and Great Northern railways), to Orrin Junction, 3[illegible] miles, where connection is made with the Colorado & Southern Ry. to Denver and Gulf ports. These four railways are owned by the same interests. The maximum grades on the new line are [illegible] 0.[illegible]%, with two pusher sections having grades of 0.[illegible] to 1.[illegible]%. The maximum curvature is [illegible] on most of the line, and [illegible]° in some parts. There is some very heavy construction, and the line traverses three deep and narrow [illegible], the Wind River cañon being about eight miles long. For about 10[illegible] miles west of Orrin Junction the new line parallels the Chicago & Northwestern Ry. line to Lander, Wyo., both lines following the Platte River.

Two extensions or links in the Burlington system are [illegible] east of Orrin Junction, one from Bridgeport to Newark, Neb., and the other from St. Joseph to Mexico, Mo. These will complete a low-grade line from the Ohio River at Metropolis, Ill., and the Mississippi at St. Louis, to the Northwest and Pacific ports. The new Ohio River bridge and connections between Metropolis, Ill., and Paducah, Ky. (now under construction), will also establish connection with the South.

Conference of Hydraulic Engineers—A conference of hydraulic engineers engaged in water-resource investigations was held last week at the offices of the Water Resources Branch of the Geological Survey at Washington, D. C. [illegible]

ments and equipment used in hydrographic work. The following papers were included in the program: "Standardization of Equipment," G. L. Parker; "Refinement Justified in Field Equipment and Methods," C. C. Covert and W. A. Lamb; "Automatic Gages"; "Work of Groundwater Division," O. E. Meinzer; "Method of Correcting River Discharge for a Changing Slope," B. E. Jones; "Determination of Drainage Areas" J. H. Morgan. Further information can be obtained by addressing John C. Hoyt, Hydraulic Engineer, in charge of Division of Surface Waters, U. S. Geological Survey, Washington, D. C.

Alum for Water Coagulation at the water-purification plant of Columbus, Ohio, will be manufactured by the city in a plant which it is expected will be put in operation by Dec. 15. Either bauxite or halloysite will be bought in carload lots. The ore will be dumped into a crusher beneath the floor. The crushed material will be lifted by an elevator which will discharge the bauxite into a pulverizer where it will be powdered so fine that 90% will pass through a screen having 200 meshes per in. The halloysite will not be pulverized, as it gives better results when merely crushed to the size of grains of crushed corn. The crushed and pulverized bauxite, or the crushed halloysite, as the case may be, will be elevated to lead-lined tanks, where it will be treated first with sulphuric acid, then boiled with steam to complete the reaction. The material will then be diluted with water and the proper quantity drawn off into a measuring tank on a lower level, and from there ejected to a chemical-solution tank. From the latter the solution will be fed into the water to be treated. Any suspended matter present in solution will settle out in the regular sedimentation basins. Commercial alum now costs about $17 per ton, f.o.b. at Columbus. It is expected that the new plant will produce alum at about $12 a ton. The plant will cost about $12,000. One ton of bauxite will make 2½ tons of 17% alum (Al_2O_3). The new alum plant will be operated about two days a week, on different days, by only one man. The plant was designed and is being built by C. P. Hoover, Chemist-in-Charge of Water Purification Plant, Columbus, Ohio. Jerry O'Shaughnessy is Superintendent of the Columbus Water-Works.

PERSONALS

Mr. G. Masunaga, Electrical Engineer of the Imperial Government Rys., Tokyo, Japan, is in this country inspecting electrified railways.

Mr. E. Wanamaker has been appointed Electrical Engineer of the Chicago, Rock Island & Pacific Ry., succeeding Mr. F. J. Glover, resigned.

Mr. George Bird, of Harrisonville, Mo., has been appointed Chief Engineer of the Grand River Drainage District of Cass and Bates Counties, Missouri.

Mr. Ivy L. Lee, recently Executive Assistant of the Pennsylvania R.R., has been appointed a member of the personal staff of Mr. John D. Rockefeller, of New York City.

Mr. James R. Valk has been appointed Western Sales Manager of the United States Asphalt Refining Co., New York City, with offices in the Harris Trust Bldg., Chicago.

Mr. Charles Hurdleston, formerly Division Superintendent of the Missouri, Kansas & Texas Ry., has been appointed Manager of the Texas State R.R., with headquarters at Rusk, Tex.

Mr. F. C. Elliott, a lawyer, of Chicago, Ill., has been elected President of the White Pass & Yukon Route, with headquarters in Chicago, succeeding Mr. O. L. Dickeson, who recently resigned.

Mr. E. P. Laird, Engineer of Roadway of the Atlantic Coast Line R.R., at Rocky Mount, N. C., has been promoted to be Superintendent of the Richmond district, with office at Richmond, Va.

Mr. Dale S. Cole, Assoc. Am. Inst. E. E., formerly Electrical and Mechanical Engineer of the Globe Stove & Range Co., Kokomo, Ind., is now Superintendent of the Reliance Gage Column Co., Cleveland, Ohio.

Mr. F. D. Egan, M. Am. Inst. E. E., Electrical Engineer of the Pittsburgh Crucible Steel Co., Midland, Penn., has been appointed Steam and Hydraulic Engineer of the company in addition to his present duties.

Mr. H. C. Westover, Assoc. M. Am. Soc. C. E., formerly of the firm of Rollins & Westover, Consulting Engineers, Kansas City, Mo., has opened an office at Beaumont, Texas, to practice municipal engineering.

Mr. F. L. Bunton, M. Am. Soc. M. E., recently Manager of the Chicago office of the Heine Boiler Co., is now Manager of the Chicago office of the Goulds Manufacturing Co., with headquarters at 3801 South Ashland Ave.

Mr. John H. Roemer, Chairman of the Wisconsin Railway Commission, is to join the organization of H. M. Byllesby & Co., of Chicago, Ill., on Feb. 1, 1915. He will be in charge of the legal business of the organization.

Mr. J. M. Tomlinson, of Bridgeport, Conn., Acting Vice-President and General Auditor of the New York, New Haven & Hartford R.R., has been elected Vice-President and Comptroller, succeeding Mr. H. M. Kochersperger, resigned.

Mr. John A. Hense, formerly with the National Malleable Castings Co., Chicago, and recently with the Dravo-Doyle Co., Philadelphia, has been appointed Manager of the St. Louis, Mo., office of the Kerr Turbine Co., of Wellesville, N. J.

Mr. L. C. Bewsey, recently Superintendent of the Indianapolis division of the Union Traction Co., of Indiana, has been appointed Superintendent of Transportation of the Buffalo, Lockport & Rochester Ry. Co., with headquarters at Rochester, N. Y.

Mr. George H. Mueller, for some time Chief Engineer and now Assistant Sales Manager of the Jeffrey Manufacturing Co., Columbus, Ohio, will become District Manager of the New York office of the company on Jan. 1, 1915, with offices at 77 Warren St.

Mr. Kempter B. Miller, M. Am. Inst. E. E., of the firm of McMeen & Miller, Consulting Engineers, Chicago, Ill., has been appointed Chief Engineer for the receivers of the Central Union Telephone Co. He will continue to make his headquarters in Chicago.

Mr. H. C. Oviatt, recently Superintendent of the Old Colony division of the New York, New Haven & Hartford R.R., has been appointed Assistant Mechanical Superintendent in charge of a new bureau known as the Bureau of Fuel Economy, with headquarters at New Haven, Conn.

Mr. A. E. Seelig, former Sales Manager of the L. J. Wing Manufacturing Co., New York City, recently Manager of the machine tool department in the New York City office of Schuchardt & Schütte, has been appointed General Sales Manager of the Kerr Turbine Co., Wellesville, N. Y.

Mr. W. E. Smith, Superintendent of Construction of the Louisville & Nashville R.R., Louisville, Ky., has been appointed Superintendent of the Louisville and Nashville divisions, with headquarters at Evansville, Ind., succeeding Mr. John W. Logsdon, temporarily retired on account of ill health.

Messrs. Frederick Holbrook and W. S. Patton, of the Holbrook, Cabot & Rollins Corporation, General Contractors, New York City, sailed for France, Saturday, Dec. 5. It is reported that the firm has large contracts for rebuilding French bridges under consideration. At present the firm has several subway contracts in New York City.

Maj. Gen. William W. Wotherspoon, U. S. A., retired, is to be appointed Superintendent of Public Works of New York State under the administration of Governor-Elect Whitman, according to press announcements. Gen. Wotherspoon was born in 1850 and was appointed a Second Lieutenant of Infantry from civil life in 1873. All his army service was with the Infantry branch of the service. At the time of his recent retirement he was Chief of Staff of the United States Army. The salary is $6000 per annum.

Messrs. George C. Whipple, M. Am. Soc. C. E., Consulting Engineer, New York City, and Professor of sanitary engineering at Harvard University; W. T. Sedgwick, Professor of biology and public health at the Massachusetts Institute of Technology; Milton J. Rosenau, Professor of preventive hygiene at Harvard University; William J. Gallivan, a physician, of Boston, Mass.; David L. Edsall, Professor of clinical medicine at Harvard Medical School, and Joseph E. Lamoreaux, a physician, of Lowell, Mass., have been appointed members of the advisory council to the Massachusetts State Commissioner of Health, Allan J. McLaughlin.

Mr. Maxwell Carson Maxwell, M. Am. Soc. M. E., for the past seven years head of the Department of Applied Mechanics, Pratt Institute, Brooklyn, New York City, and a consulting engineer, has become identified with the Yale & Towne Manufacturing Co., of Stamford, Conn. He is now Superintendent of Power and Plant and is responsible for the power generation and distribution, the building maintenance, all new building construction, the general repairs and maintenance of all machinery, shafting, etc., throughout the plant. He also has charge of the tool department, being responsible for all tool designing, the machine shops for building tools and the forge shop.

Mr. William B. Landreth, M. Am. Soc. C. E., City Engineer of Schenectady, N. Y., has been appointed Deputy State Engineer of New York under the State Engineer-Elect,

[illegible] Amsterdam, N. Y. [illegible] White Plains, Port Jervis and [illegible] N. Y. [illegible] In 1897 he was appointed [illegible] of the New York State Barge [illegible] was made [illegible] Resident Engineer, and [illegible] State Engineer in charge of the Barge Canal.

[illegible] President of the E. I. Du Pont de Nemours Powder Co., of Wilmington, Del., has [illegible] a 100-mile boulevard to the State of Delaware [illegible] the United States Supreme Court [illegible] that the law passed by the Delaware legislature [illegible] authority to acquire land for right-of-way by condemnation proceedings is constitutional. The work of construction was begun about two years ago, but was held up by a [illegible] who sought to prevent the [illegible] of his land. The Delaware court decided against the [illegible] who then appealed to the U. S. Supreme Court. The [illegible] subsequently died and his heirs declined to continue the suit. The Supreme Court recently dismissed the suit without a ruling on the constitutionality of the law, and it will be necessary to institute another suit to get a decision on this point.

OBITUARY

Charles Arthur Moore, President of Manning, Maxwell & Moore, New York City, died recently on the steamship "Rotterdam" while en route to Naples, Italy.

William David Cantillon, former General Manager of the Chicago & Northwestern Ry., died at his home in Chicago, Ill., Dec. 14. He was born in 1861 and entered the service of the Chicago & Northwestern Ry. as a brakeman in 1883.

James H. Waters, President and General Manager of the Florence & Cripple Creek R.R., died Nov. 27 at Colorado Springs, Colo., from injuries received on Nov. 25 when a railway motor car in which he was riding collided with a locomotive.

Eli Stillson Hart, Chairman of the Board of Directors of the Rodger Ballast Car Co., Chicago, Ill., died Nov. 23. He was born in Rochester, N. Y., in 1832 and was educated as a lawyer. In 1874 he gave up the practice of law and was one of the founders of the Rodger Ballast Car Co.

[illegible] Cooper, a retired civil engineer, died Dec. [illegible] at his home in [illegible] County, Va., aged 68 years. He was born in Baltimore, Md., and for many years had charge of construction work for H. A. Ramsay & Co., of Baltimore, including the [illegible], Va., waterworks and the St. Paul St. Bridge, Baltimore.

[illegible], Past President of the American Society of Mechanical Engineers, died Dec. [illegible] at his daughter's home in New York City. He had been in ill-health for several months. A portrait and biographical sketch were published in "Engineering News," [illegible] at the time of his election to the presidency of the American Society of Mechanical Engineers.

[illegible] a member of the staff of Mr. Charles T. Main, M. Am. Soc. C. E., of Boston, Mass., [illegible] M. Am. Soc. C. E. [illegible] Recently he had been in charge of construction work in Montreal.

[illegible] of the Pennsylvania R.R., at [illegible], Penn., died Nov. 21 at his home in [illegible]. He was born at [illegible] in 1867. He attended [illegible] College for two years and then entered the [illegible] of the Pennsylvania R.R. as a rodman. He [illegible] in 1903.

SOCIETY OF CONSTRUCTORS OF FEDERAL BUILDINGS.
Jan. 4-6. Convention at Washington, D. C. Secy., T. R. [illegible], 4217 Westminster Ave., Philadelphia, Penn.

ASSOCIATION OF GOVERNMENT CONTRACTORS.
Jan. 4-7. Annual meeting at Washington, D. C. Secy., [illegible], Algernon Bldg., Montgomery, Ala.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.
Jan. 19. Annual meeting at New York City. Secy., J. R. Wemlinger, 11 Broadway, New York City.

AMERICAN WOOD PRESERVERS' ASSOCIATION.
Jan. 19-21. Convention at Chicago, Ill. Secy., F. J. Angier, Mt. Royal Station, B. & O. R.R., Baltimore, Md.

AMERICAN SOCIETY OF CIVIL ENGINEERS.
Jan. 20-21. Annual meeting in New York. Secy., Charles Warren Hunt, 220 W. 57th St., New York City.

AMERICAN SOCIETY OF HEATING & VENTILATING ENGINEERS.
Jan. 20-22. Annual meeting at New York City. Secy., J. J. Blackmore, 29 W. 39th St., New York City.

AMERICAN CONCRETE INSTITUTE.
Feb. 9-12. Convention at Chicago, Ill. Secy., E. E. Krauss, Harrison Bldg., Philadelphia, Penn.

AMERICAN CONCRETE PIPE ASSOCIATION.
Feb. 15-16. Annual convention at Chicago. Secy., E. S. Hanson, 538 South Clark St., Chicago, Ill.

St. Louis Railway Club—The Christmas entertainment of the St. Louis Railway Club will be held in the auditorium of the American Hotel Annex on the evening of Dec. 18. The Secretary is B. W. Frauenthal.

Seattle Association of Members of the American Society of Civil Engineers—At the November meeting of the Association representatives of the various technical societies of Seattle were present to discuss the feasibility of a federated union.

American Society of Civil Engineers—George A. Harwood has been nominated for Director of the Society (first district) on an independent ticket, as against the regular nominee, Frederick Mollitor. The other nominations were noted in our issue of Oct. 22.

American Institute of Architects—At the 48th annual convention held in Washington, D. C., Dec. 2-4, the following officers were elected: R. Clipston Sturgis, President; Thomas R. Kimball, First Vice-President; D. Knickerbacker Boyd, Second Vice-President; Burt L. Fenner, Secretary; John Lawrence Mauran, Treasurer.

Southern California Association of Members of the American Society of Civil Engineers—At the annual meeting of the Association, held at Hotel Clarke, Los Angeles, Calif., Dec. 9, the election of the following officers was announced: President, Capt. C. T. Leeds; Vice-Presidents, H. Hawgood, G. S. Binkley, Charles H. Lee, W. K. Barnard. The membership of the Association is now 93.

St. Louis Engineers' Club—At the recent annual meeting of the Club it was voted to appropriate [illegible] of the general funds as the beginning of a building fund for the construction of a new home for the Club. It is hoped that the new building will be completed before the end of 1915. The results of the annual election will be announced at the annual banquet at the City Club on Dec. 16. The nominees for President are E. L. Ohle, H. J. Pfeifer and J. W. Woermann.

Highway Engineers' Association of Missouri—The eighth annual meeting of the Association is being held at Jefferson City, Mo. (Dec. 17-18). Among the papers presented are the following: "Reinforced Concrete," by E. Lee Heidenreich, Kansas City; "City Streets and County Roads," by C. M. Talbert, St. Louis; "[illegible]," by F. D. Hughes, Kansas City; "Power Road Machinery," C. M. DeWind, Chicago, Ill.; "[illegible] Roads," by R. H. Russell, U. S. Dept. of Public Roads. The Secretary is Howard M. [illegible], Richmond, Mo.

New England Water Works Association—The [illegible] meeting was held in Boston Dec. [illegible]. After the usual luncheon two papers [illegible] of small town water supplies were read. [illegible]

[illegible]

Engineering News

VOLUME 72 | DECEMBER 24, 1914 | NUMBER 26

The Hill Building: Special Building Design for Special Use

The problems of designing a building for a particular specialized use were handled with unusual care and originality in the case of the new Hill Building, New York City, the present home of ENGINEERING NEWS, occupied only a few months ago. The Hill Publishing Co. was unable to find a building in New York City suited to the requirements of a large printing and editorial enterprise, and therefore proceeded to plan and construct such a building for itself.

Located in a new growing industrial quarter of the city, the region lying north of 34th St. and west of 9th Ave., the building secures the advantages of free exposure on all sides. By employing very large glass surfaces and an exterior of cream-colored mat-glazed terra cotta and buff brick, as well as by the orientation and arrangement of its ground plan, the building retains maximum advantages as to light. By exclusive reliance on artificial ventilation with air washed and humidified, and keeping all windows locked shut, the best atmospheric conditions are secured, to the advantage of the printing operations as well as to the benefit of the occupants. By the provision of great strength in the structure—for 300 lb. live-load per sq.ft.—ample capacity is secured for any service. By spacing the columns to suit the setting of printing machinery, quite out of accord with usual arrangements, a high space efficiency is attained. By the careful study of service requirements in the details of construction and equipment, followed by the creation of numerous articles and constructions not previously manufactured, the building is made throughout to correspond in efficiency with the space utilization.

FIG. 1. THE COMPLETED HILL BUILDING, SPECIALLY DESIGNED FOR PRINTING AND EDITORIAL USE

Above all, the building is really fireproof. Except for exposure fires on the street fronts, no fire contingency can prove serious to either building or occupants. There is not a stick of wood in the structure, no wooden floors or sleepers, and no wooden window frames or sash. The windows (except on the streets) contain wire-glass. Doors are self-closing and present only asbestos-lined steel plate in integral steel frames. Vertical openings are inclosed. Even water damage through vertical openings is forestalled by dams at riser pipes, and by scuppers. Finally, the whole building is sprinkled. Therefore the lowest insurance rate in New York is secured—5.68c. per $100 on building, and 14c. on contents.

PLAN OF BUILDING

The building is roughly 99x175 ft. in plan, and has twelve stories and a mezzanine or gallery in the upper story. As the stories are materially

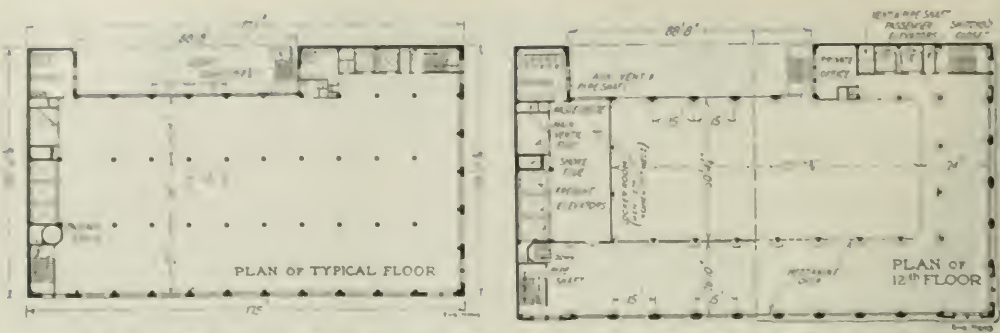

FIG. 2. TWO FLOOR PLANS OF THE HILL BUILDING, SHOWING EFFICIENT SPACE UTILIZATION

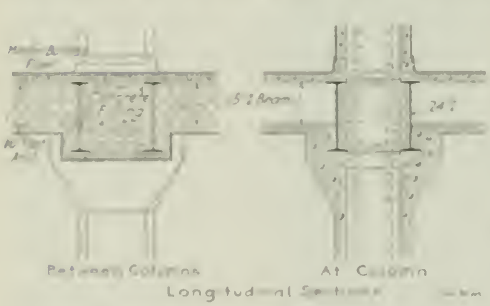
higher than is customary, being 16 ft. from floor to floor or about 14 ft. in the clear (the first story 16 ft. in the clear), the total height of the building from street to roof is no less than 206 ft.

The general plan of the building, with entrances at the diagonally opposite corners on the two street fronts, follows current practice in loft and warehouse building construction, but is worked out in detail for space utilization efficiency. By elimination of hallways at the elevator entrances, and by using the two wings at front and back of the court for service purposes (see plans, Fig. 2), the available working space of the floor is left in almost completely rectangular shape. The whole area is of full value because the window arrangement, the large glass area, and the exposed position of the building give excellent lighting all over.



As the building was designed for printing use, the governing item in occupancy was printing-press machinery. The column spacing was therefore made no wider than just enough to accommodate one press per panel. In place of the usual spacing of 20 to 24 ft., this building has panels sufficient for any probable width of press, and small enough to waste a minimum amount of space whatever size of press is installed. The longer dimension—which is transverse to the building, as presses are to be placed transversely, abutting on longitudinal gangways—ranges from 21 ft. 4 in. to 20 ft. 10 in.

The unequal lengths of bay represent one of the provisions against vibration. The different girder spans having different natural periods of vibration, it was believed that resonance effects would not occur as freely as with uniform spans. But to retain the desirable features of uniformity in column spacing, the spans are varied by only 2½ ft. from shortest to longest.

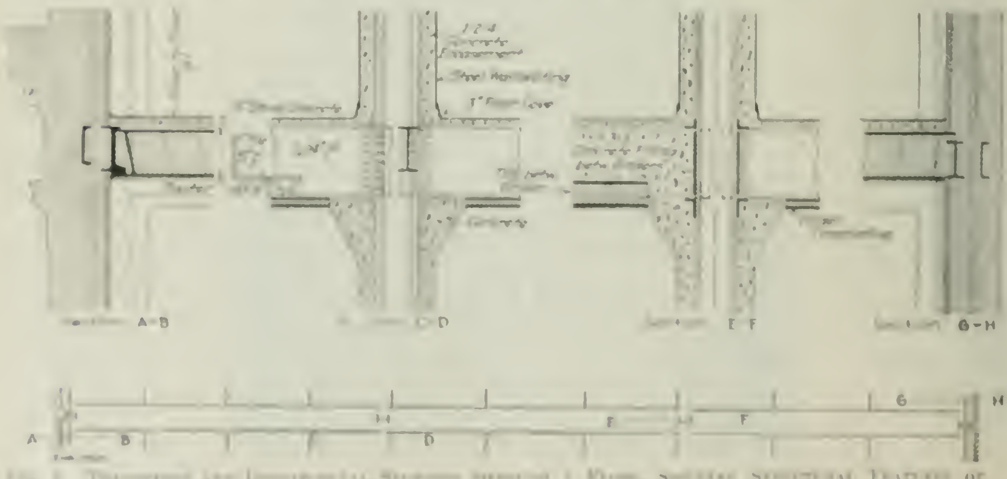


FIG. 3. TRANSVERSE AND LONGITUDINAL SECTIONS THROUGH A FLOOR, SHOWING STRUCTURAL FEATURES OF THE BUILDING

Freight-Entrance Driveway into Building

The rear entrance of the building is developed into a complete entrance and interior driveway, so that wagons can load and unload in the building, receive mail directly from the spiral mail chute, etc. The asphalt-block-paved driveway is at sidewalk level. Just at the driveway the sidewalk is sheltered by a steel-and-glass marquise, and it is over this marquise that the entrance opening for air for the ventilation system is located.

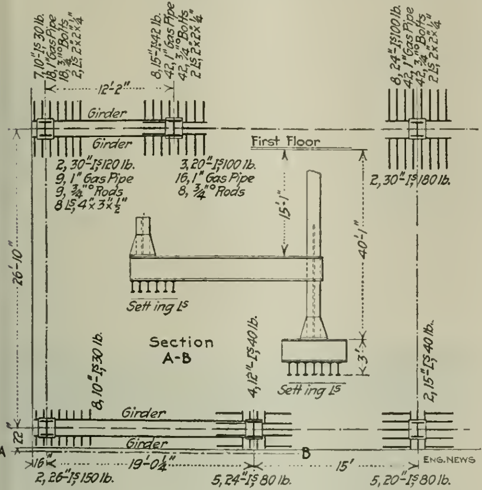

Fig. 4. Southwest Corner Grillages

Foundations and Framing

The site of the building had rock exposed nearly at ground surface. This fact limited the problems of sub-surface construction and of foundations. There is a single basement story over the whole area of the building, with a sub-basement for the boiler room only.

The location of boiler room was determined in part by a deep pocket in the rock, going down some 50 ft. below curb; as this occurred at the west end, near the originally planned location of the boiler room, the latter was shifted to occupy the pocket. The same dip in the rock is also responsible for the fact that the foundations, which generally are simple grillage footings of small size to distribute the column loads from the cast bases to rock at the unit-pressure allowed by the Building Code, include a few concrete piers.

Fig. 4 sketches the footings at the southwest corner, including group footings on the building and typical interior footings.

Structure Very Massive

The steel frame of the building,* as well as the terra-cotta floor construction, is unusually heavy, on account of the high live-load of 300 lb. per sq.ft. The steel frame weighs slightly over 2 lb. per cu.ft. of contents. In spite of the heavy construction, columns of simple Bethlehem H-section were used throughout. In the lower stories

*See an article on the erection of this frame, "Engineering News," Dec. 25, 1913, p. 1298.

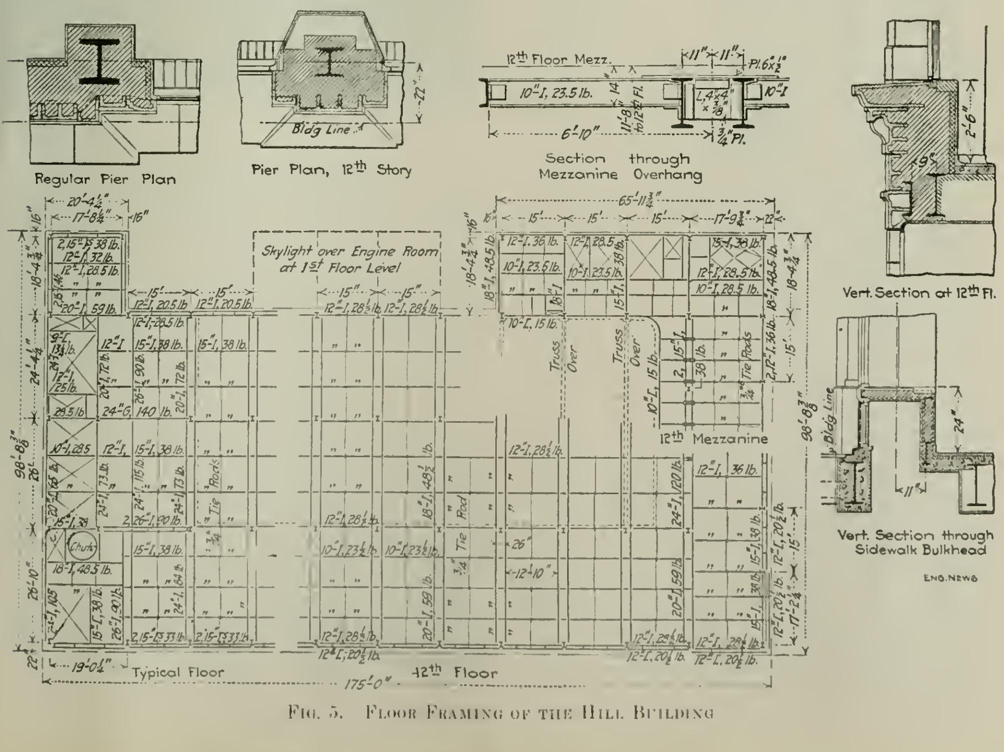

Fig. 5. Floor Framing of the Hill Building

the heaviest section rolled, the 14-in. H weighing 287½ lb. per lin.ft., was reinforced with flange and web plates to [illegible] three times its sectional area. The maximum column was 285 sq.in. section.

The floor framing presents an unusual arrangement. The main girders, running transverse to the building, are double, straddling the columns. While this arrangement was adopted chiefly with a view to getting good details for the construction of the transverse bents, it proved an advantage in laying out the beam framing. The beams are 15-in. I's, spaced about 8 ft. on centers, taking a 16-in. flat-arch terra cotta floor, the strength of both arch

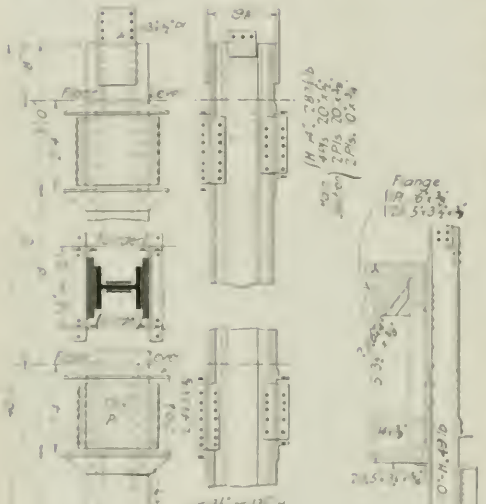

Fig. 6. Two Representative Column Details

and beams [illegible]

[illegible]

Provision for Rigidity

Printing-press buildings are notoriously weak in the matter of vibration resulting from the reciprocating movements of heavy masses in flat-bed presses. The presses used by the Hill Publishing Co. are rotaries, but as the tenants of the building would probably employ flat-bed presses the problem of suppressing vibration was considered of primary importance.

Great reliance was placed on the massive character of the structure as a steadier and stiffener. For rigidity of the transverse bents, effort was centered not on making the steel connections particularly stiff (as by brackets or by pure shear connections), but upon obtaining a securely connected composite structure through the use of concrete incasement of the columns and flaring concrete column caps merging into substantial concrete girders—the filling between the pairs of steel girders.

With the same purpose in mind of suppressing vibration and stiffening the whole construction, a rich stone

Fig. 7. View in Web-Press Department of Hill Publishing Co., 10th Floor

(Permanent lighting fixtures not in place. [illegible] has been installed.)

concrete was employed for the [illegible] of columns, filling of girders and floor surfacing layer. No cinder concrete was used anywhere except in [illegible] on the roof.

The unequal length of the transverse [illegible] in the building, already referred to, was [illegible] as a protection against vertical [illegible] rather than against lateral sway. The fact is worth recording that during the past [illegible] months' service the building has proved remarkably rigid.

Floor Construction

The [illegible] National Fireproofing Co. arch used in the floors is a novelty. The capacity of the arch is probably limited by the tie-rods rather than by the strength of the tile. In this case tie-rods were put in according to the requirements of the New York Building Code. Each floor-beam panel has one [illegible] tie-rod [illegible]

Architectural Composition and Finish

The brick-pier surface, which [illegible] characterizes the building, can be seen in the general view on the first page of this issue. The problem of securing proper appearance of a building in which flat wall surfaces are reduced to a [illegible]

believe that in this case they hit upon a pleasing solution. Unfortunately, the picture does not do the fact justice, as it cannot reproduce the appearance of the cream-colored mat-glazed terra cotta upon which the effect of the exterior really depends. The entire surface of both street fronts is of this material.

The edge faces of this terra cotta were ground, with a view to giving neat and close joints (see Fig. 8). The cost of this terra cotta face (in place) may be put at about twice the cost of face brickwork and about one-half the cost of stone facing. The court wall shows Kittaning face brick, with terra-cotta lintels. The rear wall is of common brick laid with a panel bordering of terra cotta.

Every block of terra cotta is anchored with a $\frac{3}{8}$x$1\frac{1}{2}$-in. galvanized ashlar anchor. At cornices and other special points, special anchoring is used. The balustrade which caps the wall is also of terra cotta, and here vertical tie-rods through each baluster with a continuous channel under the cap rail form the connection.

The roof is covered with Ludowici roofing brick laid in portland cement over "Barrett Specification" tarred-felt roof. Bent copper expansion-joint strips are laid in the brick at 50-ft. intervals in both directions.

Floors—As already mentioned, the floors have a 5-in. layer of concrete over the tile arches. This is stone concrete instead of cinder concrete, for strength and stiffness. It was believed that a very extensive load distribution would be secured through so thick and strong a surfacing layer; concentrated loads and impact from machinery being rendered harmless.

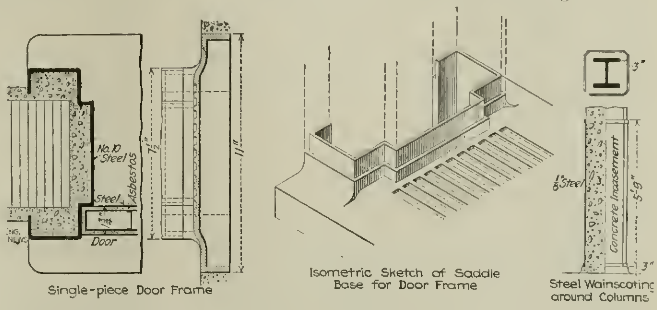

Fig. 9. Door Frame and Sill Details, and Steel Wainscoting of Columns

Fig. 8. Entrance Detail, Showing Good Effect of Glazed Terra Cotta with Ground Joints

The upper 1 in. of this 5-in. coat is Master Builders' floor surfacing, chosen for its waterproof and wear-resisting qualities. This is used on all the manufacturing floors, but is omitted on the office floors (12th and mezzanine), where ordinary concrete floor finish was used; this floor is completely covered with interlocking rubber tiling, and the concrete is thus not exposed to wear.

Reference has already been made to the column incasement. This is 1 : 2 : 4 stone concrete in a square pier with chamfered edges, which gives a minimum thickness of 3 in. over the extreme points of the steel. The lower 5-ft. height of each column is surrounded by a steel wainscot jacket of $^{11}/_{64}$-in. plate with reinforcing bands at top and bottom. This wainscot was cast in, being set around the steel column and the concrete molded in it.

Sanitary Cove—As a novel feature of the floor construction, the concrete is carried up around walls and columns to form a lip or edge 3 in. high with cove of 2-in. radius. This simple expedient greatly reduces the amount of dust accumulation occurring in corners and angles in normal service. All door frames and column wainscoting are seated on this concrete lip. The door saddles are detailed to merge into the cove and form the actual support for the door frame and casing (see isometric sketch in Fig. 9).

In the 12th and 12th mezzanine stories the column casings are surrounded by furred false incasement for architectural effect; the interior finish here is wholly of Caën stone imitation. The spaces back of the furring are utilized for carrying up the radiator risers and the air ducts.

Ceilings and walls are finished in hard plaster. In the manufacturing stories the exterior walls are furred with 2-in. hollow terra cotta for plastering.

Stair and elevator partitions are 6-in. hollow terra cotta, without steel studding. Even door bucks are dispensed with; the formed steel door-frame is set direct in the partition masonry.

The main vent shaft shows ingenious design. It is divided into a supply and an exhaust shaft. Since the aggregate area of the two should be the same for all floors, the supply decreasing from basement up and the exhaust increasing, a sloping partition might have been used to

across the shaft. This, however, would have made for two [illegible] pressure [illegible] front [illegible] along the east wall [illegible] where the ducts lead off (Fig. 10). A [illegible] partition was therefore designed, which divides the front wall into two equal parts at all floors, but swings around from the left side to the right side of the shaft all the way up through the 12 stories. The partition is formed of plaster on mesh attached to small [illegible] angles connected to a vertical front angle and a [illegible] rear-wall angle.

WINDOWS

The building is equipped throughout with steel sash [illegible] with [illegible] two [illegible]. Minimum steel

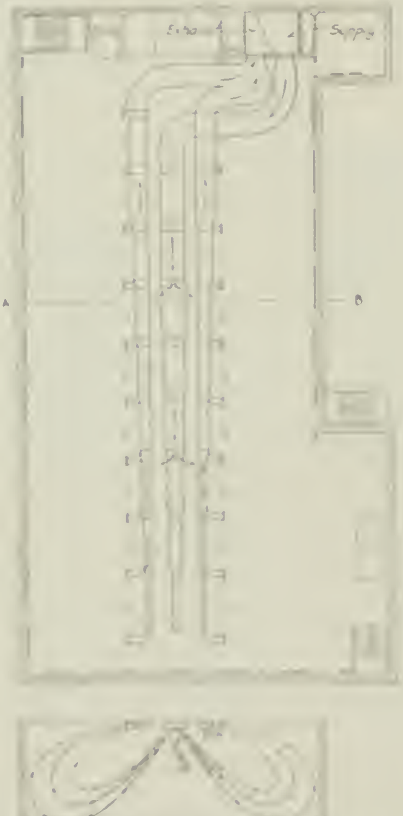

FIG. 11. [illegible] DUCT PLAN

[illegible] to a given window area, i.e., [illegible] glass [illegible] [illegible]. A careful [illegible] of the steel sash on the [illegible] was [illegible], with the result of [illegible] an [illegible] pattern [illegible] of [illegible] quality [illegible] by the [illegible] Co. These sash were fully described in Engineering News, Apr. 16, 1914, p. 8[illegible]. They are glazed with [illegible] glass. The advantages of light and [illegible] secured by these windows and by their [illegible] [illegible] is [illegible] the building. The [illegible]

sill, adjoining the [illegible] sill [illegible] of the window. A [illegible] tile with [illegible].

STEEL DOORS AND INTERIOR TRIM

All doors and door frames throughout the building are of [illegible] sheet steel. The doors themselves are not [illegible] or [illegible] but are [illegible]. The frames represent a [illegible] departure from [illegible] practice. Instead of making frame and casings three separate pieces, the whole was formed of a single width of steel sheet. Thus, a door frame comprises only three pieces of metal, the [illegible] and the [illegible], which [illegible] at the corners and are [illegible] by angles.

The door itself is made of [illegible] steel sheet over a [illegible] steel construction covered with [illegible] asbestos board. Between the [illegible] are channel-shaped ribs, to which the outer shell is spot-welded.

All doors are hung on [illegible] hinges, at upper and lower [illegible], [illegible] type. With few exceptions the doors are self-closing, the lower [illegible] being a [illegible] spring and check box set into the [illegible] sill.

HEATING AND VENTILATION

It was natural that the equipment of the entire building should be particularly adapted for printing and publishing. Printing requires uniform humidity and temperature for best results. Therefore, in the Hill Building the windows are [illegible] [illegible] and conditioned air is supplied, [illegible] [illegible] cu.ft. per min. per floor.

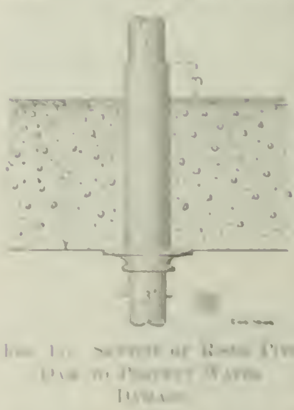

FIG. 1[illegible]. SLEEVE OF [illegible] PIPE [illegible] TO PREVENT WATER DAMAGE

The supply is drawn in from the street at the [illegible] level, passed through [illegible] screens, [illegible] through [illegible] [illegible] into a spray chamber, past drying baffles and heating coils, and finally through the fans which send it up the main vertical [illegible] through the distributing ducts on each floor. [illegible] the air is not needed, [illegible] across the [illegible] of the [illegible].

In the basement [illegible] there are three [illegible] [illegible] [illegible], each with a [illegible] [illegible] [illegible] [illegible] of [illegible] [illegible] cu.ft. per min. When the outside temperature falls to [illegible]° F., the [illegible] water is heated with [illegible] steam automatically [illegible].

Exhaust ducts [illegible] take the [illegible] to the [illegible] of the [illegible]. [illegible], are [illegible] [illegible] [illegible] [illegible] through [illegible]. In addition, two [illegible] [illegible] [illegible] from the [illegible] and [illegible] throughout the building.

The air supply is [illegible] a few degrees below room temperature so that it will [illegible] from the [illegible] and [illegible] proper circulation. The [illegible]

supply is from radiators hung on the walls of each story under the windows and supplied with hot water. The temperature of this is regulated from the engine room according only to the outside temperature (being varied between 195° in 5° weather and 100° for 65° outside).

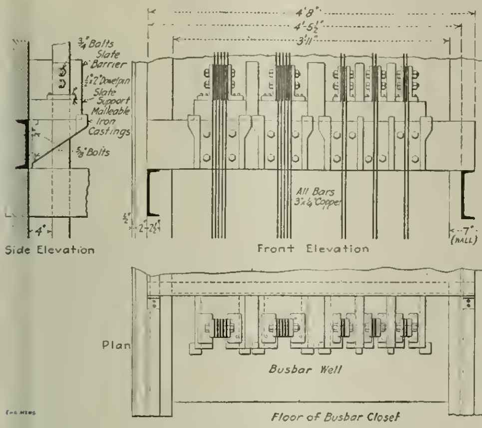

FIG. 12. VERTICAL BUSBARS IN INCLOSED WELL

(At each floor a panel-board is mounted in front of the well. Switchboard and well are inclosed in a closet.)

The circulating system has two Alberger closed heaters, using exhaust steam, and a 35-hp. motor-driven centrifugal pump with a De Laval turbine driving a pump of the same type and capacity as a spare unit.

The heating and ventilation facilities are sketched in Fig. 10 for one of the printing floors. The arrangement is modified for the twelfth floor and the ducts are concealed by the ceiling (Fig. 13).

WATER-SUPPLY AND FIRE PROTECTION

Water is pumped from two street services to a 10,000-gal. square steel tank in a house above the roof. This supplies the toilets, slop sinks, hot- and cooled-water circuits, etc., and the power plant. A 5x8-in. motor-driven triplex pump is ordinarily used, with a 10x6-in. steam duplex as a spare unit (both McGowan designs). Hot water for the slop sinks and wash sinks comes from a gravity circulating system using exhaust steam in a closed heater.

Drinking water is taken from the house line, filtered, cooled and circulated around the building, there being two bubbler fountains on each floor. For cooling the water a 4-ton 10-hp. York ice machine is used and a 2-hp. motor-driven centrifugal pump circulates the supply.

For the sprinkler system, water is stored in four 9000-gal. cylindrical closed tanks under the house tank. To secure adequate pressure on the upper floors of the building these tanks carry 80 lb. air pressure (obtained from a Westinghouse locomotive-type direct-acting double-compound steam-driven compressor which also supplies the air-washer sprays and the pneumatic carriers). One main sprinkler riser drops down through the building with branches for each floor. Should any valve be closed or any sprinkler head let go, alarm circuits are closed to advise an insurance supervisory bureau. In case of such warning, a runner is dispatched to advise of the trouble and see that it is remedied. The sprinkler mains also have a siamese street connection for fire engines. Each floor has two hose racks with connections to the house

FIG. 13. INDIRECT LIGHTING AND ORNAMENTAL OUTLETS OF CONCEALED VENT DUCTS IN OFFICE OF HILL PUBLISHING CO.

(12th floor, Hill Building)

[illegible]. A [illegible] fire-alarm system, with [illegible] boxes and bells on all floors, connects directly with the city fire department.

To prevent damage from water dripping through the floors, scuppers with [illegible] are provided to drain the floors into the [illegible]. The [illegible] risers which pass from floor to floor are carried through the floors in pipe sleeves (Fig. [illegible]), which rise above the finished surface some [illegible] in. to serve as a [illegible] for accumulated water.

Lighting and Power Service

Each manufacturing floor has some 60 ceiling outlets for lighting, besides 42 floor and 22 pilaster and column outlets for power. Such of these floors as are used by the Hill Company have [illegible]-reflecting ceiling fixtures, each with a [illegible] nitrogen-filled incandescent lamp. This gives about [illegible] per sq.ft. of floor area, which is supplemented by a few individual lamps for the [illegible] parts of presses and some proofreader's desks.

From the high ceiling of the twelfth floor, there are hung [illegible] indirect fixtures, each reflecting the light of [illegible] lamps. This allows about [illegible] per sq.ft. of floor. Above and below the mezzanine are two similar fixtures per bay, each containing three [illegible] lamps, giving [illegible] per sq.ft. of floor, but about the same resultant illumination is secured as [illegible] from under the mezzanine.

Vertical Busbars

Current for the several floors is supplied from the power-plant switchboard through five vertical busbars, [illegible] for the three-wire 240-volt lighting circuits and [illegible] for 240-volt power. Each lighting bus comprises two [illegible] copper bars and each power bus [illegible] for each [illegible].

The busbars are [illegible] in lengths reaching from floor to floor. They pass through a special well and at each joint are bolted together and to a [illegible] which rests on a [illegible] insulating block supported by [illegible] to the floor beams.

Power Plant

The [illegible] [illegible] and the power is [illegible] supply of the [illegible] [illegible] electric [illegible] [illegible] of 1350 kw. There are three engine-generator units on the basement floor and three [illegible] boilers in a sub-basement. There are [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible].

The [illegible] of the [illegible] [illegible] [illegible] [illegible] [illegible] built by the [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] with 150-lb. steam pressure. The [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] a [illegible] gallery.

The boilers have [illegible] balanced draft and [illegible] to the freight driveway.

The [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] [illegible] of hand labor. Coal is dumped through sidewalk scuttles into a 500-ton sloping-bottom storage bin from which it runs through four gates 4 ft. above the floor. A 1000-lb. bucket receives it and is hoisted by an electric trolley crane (designed by the Northern Engineering Co., with a scale in the track) and carried to the stoker hoppers.

The entire plant is thoroughly provided with recording, as well as indicating, meters and gages (Venturis for steam, a Cochrane metering feed-water heater, outside and inside thermometers, circulating-system thermometers, voltmeters, ammeters and wattmeters for power and lighting, air and steam-pressure gages, etc.), assembled so far as practical, so that there is complete supervision of operation and check on efficient performance.

Conveying Facilities

The equipment for the necessary movement of persons, freight, mail, printers' copy and proofs, waste, etc., comprises power elevators, gravity chutes and pneumatic carriers, the first two serving all floors and the last only the editorial and printing departments of the Hill company.

There are two [illegible] Otis electric passenger elevators carrying some [illegible] persons each (or 1500 lb.) and developing a possible speed of 600 ft. per min. The three [illegible] freight elevators have a 7x16-ft. floor and a lift of 8000 lb.; they open into the 20-ft. interior freight driveway, so that vehicles can discharge and load at the elevator doors.

A [illegible]-ft. spiral steel chute, with three separate slides, serves all floors for the descent of outgoing printed matter, mail, etc. One slide delivers over the sidewalk and two beside the freight elevators. There is a straight vertical steel chute for dropping waste paper into the baling room on the ground floor.

Starrett & Van Vleck, of New York, were the architects of the Hill Building, and also carried on the construction as superintendents. John A. Hill, President of the Hill Publishing Co., was active in all stages of the design and construction.

Fumes from Gasoline Locomotives in Tunnels and Mines—[illegible]

Reconstruction of the Beds of the Cincinnati Water-Filtration Plant

The beds of the rapid sand filters of the water-works of Cincinnati, Ohio, are being reconstructed. The brass wire-cloth screen between the sand and gravel layers is being removed, and the depth of the gravel layer increased to 14 in. in place of the 8 in. of gravel formerly used. The sand layer will remain 30 in. in depth, as heretofore. This will decrease the distance between the level of the sand and the top of the wash-water troughs about 6 in. Thus far, two of the 28 beds have been reconstructed and one is now under reconstruction. Eventually, all of the beds will be changed.

On account of the breaking of the brass wire screen and the consequent trouble encountered with the mixing of the sand and gravel, it is deemed advisable to remove the screen entirely, as experiments made at the plant had shown that this was feasible when the gravel layer is properly graded. In some places the screen was found to be torn away from its original fastenings because of their faulty character, while in others the wires of the cloth were broken. Unequal distribution of the wash water resulted in such cases, and although no bad effects have been traced to the breaks, so far as shown by the bacterial results, it has been thought best to make these changes before serious disturbances which might affect the purity of the water could take place.

The brass wire-cloth was constructed with No. 20 wire and had 10 meshes per lin.in., or 100 per sq.in. It has been in use for seven years, although evidences of its deterioration were noticed within three years from the time the plant began to be operated. The destruction of the wire cloth appears to be due to the small quantity of carbonic acid which remains in the filtered water after undergoing treatment. Corrosion of the wire of the cloth is plainly evident, and is progressing rapidly in places. The slight movement of the wire cloth due to the washing process is another factor in hastening the rupture of the wires. They become brittle under this movement, which, coupled with the lessening diameter of the wires on account of corrosion, causes them to break easily.

The original cost of the brass wire-cloth alone for the 28 filter beds, each of which has an area of 1100 sq.ft., was $10,688. To replace the screen and to provide better methods of fastening it would have probably cost between $20,000 and $25,000, including labor and material. Reconstruction of the beds without the screen and with deeper, larger and heavier gravel, will probably cost about $8500, including the rehandling of the sand, the screening of the gravel, and the necessary repair work upon the strainer plates. The latter require some cleaning out of the perforations ($\frac{3}{32}$-in.), and in some places a renewal of broken hook bolts is necessary.

The sand in each bed is being lifted by a portable hydraulic sand ejector and transferred to a bed, the bottom or gravel layer of which has already been reconstructed. The transfer of the sand by the ejector from one bed to another will effect a certain amount of cleansing of the sand.

The new gravel costs $1.39 per ton delivered at the filtration plant. This is equivalent to approximately $2.08 per cu.yd., and will amount to about $1500 for the new gravel for the 28 beds. Separating, grading, and placing the gravel, together with the necessary repair work and transferring the sand, will bring the total cost of reconstructing the beds up to the figure previously mentioned.

J. W. Ellms is Superintendent of the Filtration Plant and J. A. Hiller is General Superintendent of the Cincinnati Water-Works.

The Cobwell Garbage-Reduction Process

A single-unit garbage-reduction process which extracts the grease and converts the remaining solids into animal food, all in one small tank, has been under experimental and practical test for about a year past. The system is all the more noteworthy because the small size of a unit makes it possible to treat the garbage of even a small city by reduction, a thing heretofore thought to be impracticable. The new system has been in use at New Bedford, Mass., for six months, and is being installed at Los Angeles, Calif., and at the Panama-Pacific Exposition at San Francisco.

In this new system the garbage is treated in airtight units (steel tanks) of about three tons capacity. Here it is heated with a solvent for 6 to 10 hr. at a temperature sufficiently low to retain all the food values. Grease is drawn off continuously until practically all of it is removed. The tankage is then taken from the digestor, screened, and, so far as is necessary, crushed to the form of a meal, ready for stock food. Garbage meal made by this process is said to contain 20% of protein and animal meal (from dead animals) 65%. It is also said that from one ton of garbage about 500 lb. of solids and 100 lb. of grease are recovered, only some 2% of grease being left.

The process was first tested experimentally at the works of the C. O. Bartlett & Snow Co., Cleveland, Ohio, under the personal direction of Mr. Bartlett. For the past six months a unit has been in regular use as a part of the reduction plant of the New Bedford Extractor Co., of New Bedford, Mass., under the direction of M. J. Springborn, who, as Director of Public Service of Cleveland, was responsible for the municipal garbage-reduction plant of that city. In two or three months the whole of the New Bedford reduction plant will be changed over to the new system.

A practical test of the use of the stock food for hogs and chickens has been made by Mr. Bartlett at his farm, with satisfactory results.

At Los Angeles a 100-ton plant is being installed by the C. O. Bartlett & Snow Co., to carry out the contract awarded by the city in 1913 to C. D. Crouch. Under this contract (see ENGINEERING NEWS, Aug. 28 and Nov. 27, 1913), the city is to be paid 51c. per ton for all garbage delivered by it to the plant. It is expected that the Los Angeles plant will be completed in about four months.

The Panama-Pacific Exposition plant will consist of two units. It will be in operation about the middle of February, 1914.

The name Cobwell, which has been given to this new system of garbage reduction, is made up from the initials of Mr. Bartlett and from the name of the chemist, Mr. Wells, who has carried through the chemical end of the work.

XI--The River Tunnels

The Harlem River Tunnels

The general design of these tunnels is shown in the cross-section, Fig. 76. It was determined by two principal factors. First, the necessity on account of the conditions under which the approaches were located of keeping the tunnels as near the surface as possible; second, the desirability of obtaining a minimum total width to avoid encroachments on valuable private property.

The methods developed in the construction of the tunnels under the Harlem River for the original subway (see Engineering News, Oct. 13, 1904) and at Detroit‡ for the tunnels of the Michigan Central Ry., had shown the practicability of sinking tubes from the surface, and these methods also permitted much closer spacing than would have been possible with shield-driven tunnels, which latter would necessarily or at least most conveniently have had to be circular, with a reasonable space, say 10 ft. or so between each tube. It may be noted, however, that the tunnels which had been previously built by sinking from the surface were for two tracks only, whereas, the new Harlem River tunnel is for four.

Bids were originally called for late in 1910 on two types, H and K. Type H was similar to that of the original Harlem River tubes, and type K similar to the Detroit River tubes.

The bid prices were as follows, per lin. ft. of four-track tube:

Type K—Lowest $[illegible], highest $[illegible], per lin. ft. of four-track tube.
Type H—Lowest $[illegible], highest $[illegible], per lin. ft. of four-track tube.

Before the contracts were awarded it was decided to change the dimensions; the bids were therefore rejected and the work readvertised, this time calling for bids on three types, H, K and L. Types H and K remained the same except for the changes in dimensions. Type L was a modification of Type H, having the four tubes all together instead of in two pairs.

The bids on the latter two types were all rejected and that of Messrs. Arthur M. Mullen and Olaf Hoff, the lowest bidders on type K, was accepted; the range of bids at this last letting for the lower-tunnel section having been as follows, per lin. ft. of four-track tube:

Type K, $[illegible] to $[illegible], [illegible] bids
Type H, $[illegible] to $[illegible], [illegible] bids
Type L, $[illegible] to $[illegible], [illegible] bids

The contract price of $[illegible], equal to $[illegible] per lin. ft. of tube, may be compared with the cost of the Detroit River Tunnels, which has been given as $[illegible], exclusive of contractors' profits. However, the inside diameter of the Detroit tunnels was [illegible] ft., as compared with [illegible] ft. [illegible] in. for the Harlem River tubes.

The method adopted by the contractors with very few modifications was that developed for the construction of the Detroit River Tunnels, which has been quite fully described§ in various papers and articles in the technical press. The article in Engineering News, of Feb. 15, 1906, is interesting as showing the development of the process. It consists essentially in the erection of the steel tubes in suitable lengths on shore, bulkheading the ends to get flotation, launching these sections, towing them to the site which has previously been dredged to the required depth, and sinking them in place by filling them with water (see photographs in Fig. 75). The concrete is then deposited around the outside by means of tremies, the sections unwatered and the inner concrete lining placed. This method, of course, obviates the necessity of general work in compressed air, though divers are used to a limited extent.

The accompanying drawings and photographs show the essential details of the structure and the methods of sinking and as the general methods have already been so fully described, it seems only necessary to call attention to such changes and improvements as experience and the particular conditions of the Harlem River work have shown to be desirable. The tunnel was divided into five sections, four of 220 ft. each and one of 200 ft.

In the Detroit River tubes, the circular stiffening angles, which are spaced about 8 ft. apart, were placed on the inside, as then it was thought necessary to provide temporary interior bracing in the form of the spokes of a wheel. Experience showed, however, that this might be dispensed with, and on the Harlem River tubes the stiffening angles were placed on the outside. This permitted the construction of the braces or struts to the wooden bulkheads or forms at the sides, which materially decreased the necessary thickness of the timber, which latter, in the case of the Detroit tunnels, was [illegible] in. thick at the bottom and [illegible] in. thick at the top. For the Harlem River Tunnels, [illegible] in. plank was used for the lower half and [illegible] in. for the upper.

The manner of making a tight joint between each of the sections shows an important modification in the direction of simplicity. The old joint with the pilot pin is shown in the drawing, Fig. 77a. This joint was not altogether satisfactory, as it was somewhat difficult to fit and the rubber gaskets are, of course, perishable. The new joint (see Fig. 77b) is a butt joint instead of an overlapping or sleeve joint, and the bolts on the outside are easily placed by divers. The inner plate, which, of course, is riveted in place after the tubes are unwatered, insures practical water-tightness. It will be remembered that the concrete is placed outside this joint before the tubes are unwatered, and tests made with the concrete deposited by the tremies at Detroit showed it to be of very good quality, sufficiently impervious to prevent any leakage of moment. The space between the joint in the shell and the inner plate is to be filled with grout after the latter is riveted in place. There is a pilot pin on each of the two outer tubes and when both are home, the accuracy of the construction insures a good fit everywhere. The unwatering of the tunnels has shown these joints to be remarkably tight.

Fig. 75. Views of the Harlem River Tubes during Construction

A—Construction, partial. B—Construction, completed. C—Towing to site. D and E—Sinking. F—Inside.

Attention may be called to the method of tying the tubes and the partition walls together, as shown in detail, Fig. 76. Reinforcement of 1-in. square rods is placed in the inner concrete lining. Longitudinal rods are spaced 12 in. apart at the sides. It is probable that this might be omitted and still leave the tunnels entirely safe, but is an added precaution thought advisable in view of the comparative novelty of the method.

Before launching a section, the two outer tubes were tightly bulkheaded at both ends, but the inner tubes only about 4 ft. up, as shown in the sketch, Fig. 78, that is, just high enough to provide flotation while being towed to the site. The outer ends of the *end* sections are, of course, tightly bulkheaded on all four tubes with bulkheads to stand total pressure for the depth, so they will hold when the tubes are unwatered. Photograph 75D shows the south-

erly end of the first section *A* with all the bulkheads in. At Detroit the tubes were actually launched, by allowing them to slide down the ways as a ship is launched; on the Harlem River, however, it was thought best to build the structure on an open platform over the water, so that flat-decked lighters could be floated underneath to lift them off. The lighters used were water boats which could be filled by the opening of valves provided for the purpose and emptied by pumps. They were floated under at low water, raised by the tide to lift the tubes off the platform, and then when the tubes were moved over deep water were scuttled, leaving the tubes floating. On account of the narrowness of the Harlem River, there would have been some difficulties attending launching, but, in any event, the method used was thought to be better, and proved to be practical and very satisfactory.

The method of depositing the concrete around the outside of the tubes, and tests showing the good quality of concrete so deposited, were fully described in Engineering News, Mar. 17, 1910; the method and plant used on the Harlem River was almost exactly the same with one important improvement in the control of the tremies. The tremies are so arranged that they can be raised or lowered to accelerate or retard the flow of the concrete. At the head of each tremie and attached to it, is a platform on which stands the man who controls it. Individual hoists were provided for each tremie, controlled by a continuous rope passing by the platform, so that at any position of this latter the rope could be reached by the man, and the raising or lowering of each separate tremie made almost instantly and as required.

At the Detroit River a steel grillage embedded in concrete was placed in the bottom of the trench at the joints between each section, but at the Harlem River timber bents were driven. There were 4 to 6 bents at each joint; they were framed on shore and driven by two piledrivers, moored facing each other with long followers to reach to the necessary depth. On the first section the bents were driven an inch or two low so that the tubes might be blocked up; it was found, however, that such good control was possible that they were afterwards driven almost exactly to grade.

The method of sinking the tubes is very simple; 12-in. valves are opened in the bottom of the bulkheads in the two outside tubes, allowing these latter to fill gradually with water; the two inner tubes are entirely open. The rate of sinking after the tubes are half full is controlled by air valves at the top of the main tube, if necessary. There is apparently no difficulty in keeping them level, but to aid in this two cross bulkheads are provided, reaching half-way down from the top, providing three sections from which, after the tubes are half full, the air escapes and, consequently, the amount of water entering can be controlled by opening or closing the air valves. The tendency of either end or corner to get out of level was, therefore, easily controlled. As the tubes become completely filled, the flotation is carried by the four cylinders on top, which are in turn gradually partially filled and the excess weight, which is not great, is taken by derrick boats moored on either side during the sinking. The method of control of position is shown in the diagram, Fig. 79.

Some interesting statistics are as follows:

Weight of steel per lin.ft. of structure	5600 lb.
Amount of exterior concrete per lin.ft. of structure	30.0 cu.yd.
Amount of interior concrete per lin.ft. of structure	11.6 cu.yd.
Maximum depth M.H.W. to subgrade	57.2 ft.

The weight of the structure equipped for sinking, with masts, bulkheads, sheeting, buoyancy cylinders, etc., complete is 646 tons.

Buoyancy of four cylinders (on top)	722 tons
Excess buoyancy four cylinders	76 tons

requiring 19 tons of water in each to overcome buoyancy. One hour is required to fill the structure with water.

Cross passages are provided between the tubes at approximately every 50 ft., in the outer partitions, and two openings in the whole length of the tubes through the center partition. There is a sump in each tube at the lowest point, universal-joint cast-iron pipe being used for discharge. Access shafts—one for each tube—are provided near the ends of the end sections, by which access can be obtained to the interior of the tubes after the outside concreting is completed. The ends of the last sections are fitted with slots (two angles) to take the sheeting of the coffer-dams which are built to connect them with the land sections built in open cut. The connecting coffer-dam is of a single row of steel sheet piling; clay being dumped on the outside, if necessary, to make it tight.

Roof Shields

Just north of the Harlem River the westerly branch of the subway passes under the main line of the N. Y. C. & H. R. R.R., which at this point carries all the traffic from its own lines as well as from those of the N. Y., N. H. & H. R.R., to and from the Grand Central Terminal. The railway has five tracks and is carried on a fill between high masonry retaining-walls. The base of rail of the subway line is to be between 40 and 50 ft. below that of the railway above.

It was at first thought that this work might be carried out in open cut, carrying the railroad on timber falsework, but the acute angle of the crossing, depth and character of material would have made this a somewhat hazardous undertaking, and it was finally decided to adopt the method shown in the accompanying drawings.

Timbered drifts have been driven, as shown in Fig. 80, the center one, as will be noted, being considerably higher than the other two on the outsides. The material encountered has been mostly rock, but the work was rendered quite difficult in parts by reason of the fact that the top of the rock was just below the top of the drifts, requiring the support of the earth overhead and blasting of the rock below.

In these drifts the side and center walls are to be built of concrete and then the balance of the excavation is to be taken out under the protection of the double, segmental roof shields, details of which are shown in the drawings, Fig. 81. These shields, as will be seen, are quite unique in design and form. It is intended to work each independently of the other, shoving one at a time, but, of course, not to be the extent of one entirely clearing the other, as they necessarily react on each other to take up the side thrust.

The writer is especially indebted to Mr. Olaf Hoff, of the firm of McMullen & Hoff, the contractors for this work, for the above information, for the plans and details of these shields, and of the Harlem River tubes, he being principally responsible for the design and execution of this portion of the work.

The East River Tunnels

The additional connections between the new lines in Brooklyn and those in Manhattan are to be by means

of two pairs of tunnels under the lower end of the East River, as described in ENGINEERING NEWS, Apr. 30, 1914. The contracts for all four tunnels were recently awarded to the Flinn-O'Rourke Co. on a total amount of about $12,500,000, and work was actually started about Nov. 1 on the sinking of the shafts.

The tunnels are to be driven by the shield method and there are two novel features which are to be tried to which attention may be called at this time.

In several places the roofs of the tunnels are quite close to the river bed, so that additional cover must be provided. Owing to the swiftness of the tidal current at this point and its scouring action, the problem of retaining a clay blanket in place according to the method heretofore used in East River tunneling seemed to be one of some difficulty. The method proposed, however, will not only probably retain the clay, but by placing the material at this time (November, 1914) it will settle well into position and become nearly impervious, by the time the tunnels are driven. A comparatively narrow, thin blanket of clay is first deposited on a line on each side of the location of the tunnels. Rock from any of the numerous excavations always going on in and around New York is dumped on top of this and a clay blanket varying in thickness from 5 to 15 ft. is then dumped between these piles of rock, and is finally covered with other rock, as shown in the sketch Fig. 82. This blanket will be approximately 125 ft. in width over all. It is believed this clay blanket will stay in position and effect the desired purpose. The contractors have been fortunate in being able to obtain an excellent grade of clay from dredging in progress on the Hudson River, near Edgewater, N. J., which ordinarily would have to be towed to sea for disposal.

The second feature is a method of filling the annular space around the outside of the tunnel left behind the tail of the shield, after the latter is shoved ahead. The outside diameter of shields used for tunneling is usually from 6 to 8 in. greater than the outside diameter of the tunnel, thus leaving a space of 3 or 4 in. all around to be filled by the movement of the surrounding material or in some other manner as the shield is forced forward. This movement, while not always of importance, does tend to pro-

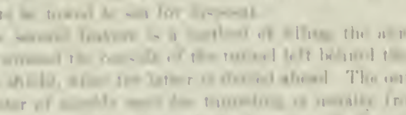

FIG. 82. METHOD OF COVERING RIVER BOTTOM OVER EAST RIVER TUNNELS

duce distortion in the cast-iron lining and a settlement of the ground above the tunnel, which latter may be very disastrous by reason of possible damage to overhead structures, as in the street approaches to these East River tunnels, and as happened in Joralemon St., Brooklyn, during the construction of the Battery tunnel on the first subway line to Brooklyn. In such materials as that under the East River, which is mostly sand and gravel, and especially with the tunnels so near the surface, any disturbance of the ground above the tunnels, [illegible], is undesirable. The prevention will probably also tend to lessen the waste from pumping air.

The shield is to be built with a double skin of 1/2-in. plates separated by a space of 1 1/4 in. The clearance between the shield and the tunnel is 3/4 in. The two skins are separated by 1 1/4x1/2-in. separators. Eight rectangular pipes 7/8x1 1/8 in. inside, 1/8 in. thick, project through the back of the shield, and gravel similar to that used for roofing purposes, is blown through these pipes by air pressure to fill the space as the shield is shoved ahead.

Experiments on a small scale have already been made which show fairly conclusively the feasibility and practicability of this method for preventing any movement of the surrounding material into the space left by the shield, but a full-size shield is now nearing completion with which final tests are to be made with the complete apparatus.

If the two improvements above described succeed in any marked degree in overcoming the difficulties usually experienced in tunneling through water-bearing loose sand and gravel, with light cover, by reason of blowouts, the generally quite considerable loss of air, consequent heating of the tunnel, and the settlement of the ground above, they must be considered as a distinct advance in the art of subaqueous tunneling.

The writer is indebted to John F. O'Rourke and W. Gray, who have developed these methods, for the above information.

Some Results of Experience with Piles and Pile Tests

The following interesting statement is made by J. W. Taussig, for the part of the Raymond Concrete Pile Co. It is elicited by our request for information on pile tests and the conclusions derived from the results of that test.

In the last fifteen years the Raymond company has made upward of 200 tests on piles of all kinds, driven under every condition. Wood, precast, and various kinds of molded-in-the-ground piles have been loaded, and close observations made as to their behavior. Without drawing any comparisons, the following facts have been learned which are applicable to all pile tests:

1. *Age of Pile*—The bearing power of a pile increases greatly with the time the pile is in the ground. The increase is very rapid immediately after the pile is driven and continues for an uncertain length of time. Our experience leads us to believe months elapse before the full strength of the pile is developed.

2. *Speed of Loading.* The test load a pile will carry more nearly approaches the ultimate value of the pile if the load is applied slowly. By ultimate value we mean the load under which the pile would fail after the structure it is designed to carry is in place. [illegible] Just what relation the ultimate load bears to the time allowed for testing we have been unable to determine.

3. *Vibration.* Vibration of the pile, [illegible] will not appreciably reduce the test load carried, unless the soil is of quicksand or very soft character. A pile in soft material depends almost entirely on skin friction generated by the adhesion of the soil to the pile and not on the ordinary friction due to compression of the soil as well as its adhesion. The adhesion of the soil when acting without the assistance of compression is apt to be

destroyed by shocks so that failures may come suddenly under comparatively light load.

Comparison of Test Load and Bearing Power

Economic circumstances usually require the test to be made under the worst conditions for the pile. The sooner a pile can be tested, the quicker the work can proceed, which is always of great importance. The same desire for speed necessitates the loading of the pile in the least possible time, so that often 50 or 60 tons is placed in a single day. The test is often made while other piles are being driven in close proximity. This sets up the most violent vibrations in the test load.

Under actual conditions the load is put on the piles very slowly. By the time the structure resting on the piles is completed, enough time has elapsed to allow the piles to reach their full or ultimate value. Even though the foundation may be subjected to vibrations after the structure is completed, the effect of these shocks is minimized as the entire structure is bonded together and the working load is usually only half to two-thirds as large as the test loading.

It is evident, therefore, that a pile giving satisfactory results under test will give a much better account of itself when subjected to its working load. Comparisons between the bearing power of piles must be drawn under as nearly similar conditions as possible. Wood and cast piles can be tested immediately after driving, so far as their own internal strength is concerned. It is, however, unwise to test these in less than two or three weeks, as this time is necessary to allow them to get a fair bearing value. Piles molded in the ground must not be tested until the concrete has attained sufficient strength to support the load. This usually requires about three weeks, although piles only two weeks old are often tested satisfactorily. Raymond piles have been tested in three weeks to a point where the concrete at the top was under a compression stress of over 1100 lb. per sq.in. This high loading is undoubtedly made possible by the support afforded the concrete by the spirally reinforced shells, which contain about 10 lb. of steel per lineal foot of pile.

Test Method

Tests are made in a number of ways. The load, consisting of a platform loaded with sand, water, iron, lead or other material, is usually balanced on a single pile, as the testing of more than one pile at a time requires handling an excessive amount of loading material and prohibitive expense in providing a suitable holder.

The value of results obtained from loading three or four piles at a time is incommensurate with the expense and difficulties attaching to the test, as experiments have shown the loads carried on a group of piles are closely proportional to the number of piles tested.

Cost of Tests

The expense of tests varies greatly, but usually approximates $2 a ton for load applied. This seemingly high cost is due to the expense of the testing platform and other special apparatus necessary. Careful and experienced supervision is of the highest importance, as not only must the test be conducted in a suitable manner, but the results obtained must be properly interpreted in order to draw the correct conclusions.

Portable Buildings of Monolithic Reinforced Concrete

The use of portable monolithic reinforced-concrete buildings for such railway structures as oil houses, switchmen's cabins, telephone booths, and waiting stations or shelters is increasing, and these buildings have advantages in cost, durability and appearance.

The smaller buildings are hexagonal or octagonal in plan, and range from 4 to 8 ft. diameter, with a minimum ceiling height of 7 ft. 4 in. The floor is about 4 in. above the bottom, in order to provide an air space beneath, and the sides ($2\frac{1}{2}$ to 4 in. thick) are paneled on the outside

A Portable Reinforced-Concrete Building
(A shelter station for an interurban railway, but suitable also for a watchman's cabin at a road crossing.)

for the double purpose of reducing the weight and improving the appearance. At the top is a 6-in. opening, with concrete ventilator. The weight of these structures is from 2 to 5 tons. The larger buildings are rectangular in plan, 8x10 ft., and weigh about 9 tons.

The reinforcement consists of electrically welded wire mesh and horizontal bars fastened to heavy vertical bars which are placed at the corners and extend to the middle of the roof. In the smaller buildings these rods are placed radially within the roof and are hooked to a circular rod around the ventilator opening.

These concrete buildings are manufactured by the C. F. Massey Co., of Chicago, Spokane and New York. The buildings are handled by cranes or derricks, the hoisting chain being dropped through the ventilator opening and fastened to a timber placed across the inside of the roof.

Beargrass Creek Storm-Water Channel at Louisville, Ky.

By J. H. Kimball*

SYNOPSIS—The Beargrass Creek was practically an open main sewer, with an irregular channel and numerous bridges, and its banks constantly encroached by filling and its serious flooding in times of freshet. It has been straightened, deepened and lined with concrete to form a storm-water channel, an intercepting sewer being built to carry the sewage. It is 40 to 70 ft. wide, with concrete retaining walls 4 to 18 ft. high, the walls including granite and reinforced surfaces. The construction work was done by day labor.

The city of Louisville, Ky., is provided on its northern and western boundaries with a convenient means of disposal of its drainage by the Ohio River. In the eastern section, Beargrass Creek, the only open stream of material size within the city limits, has served as the natural outlet for drainage. Other smaller creeks have been replaced by trunk sewers, but this stream (draining a considerable territory both within and beyond the city limits) will remain as an open channel.

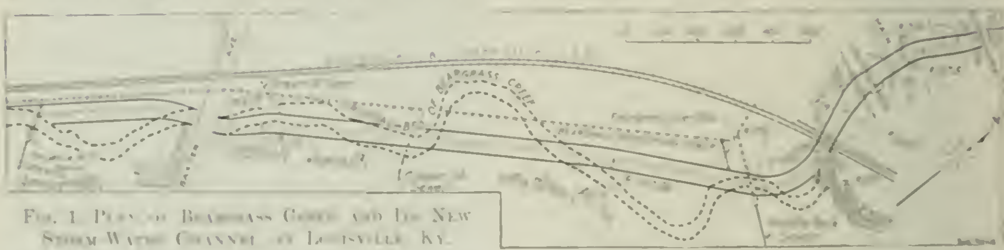

Fig. 1. Plan of Beargrass Creek and the New Storm-Water Channel at Louisville, Ky.

Beargrass Creek drains a territory of 63.4 sq.mi. The soil throughout the basin is clayey, and the surface is undulating, with some small hills of steep slopes. The maximum difference in elevation is about 250 ft. and the average slope of the branches is from 4 to 5½ per 1000. Only a small proportion of the territory lies within the city limits and this is practically all improved as a closely inhabited residence territory. The area outside of the city is largely cultivated land.

The course of the stream was originally meandering (Fig. 1), and the bed lay in a valley often of considerable width. As the property became more valuable, the waterway was improved to a slight extent by occasional straightening, but the principal change was that of filling and encroachment by which the course became much restricted. Bridges have been built, obstructing the flow to a greater or less extent, and trestles, which collected obstructions, rubbish and débris in large quantities, especially where the trestle bents were not parallel to the direction of the stream. In none of the bridges was the span equal to the present channel width. At one of the cross streets, the abutments and wing walls were so built as to interfere greatly with the flow, and other bridges were poorly designed with reference to location and direction of stream.

In addition to earth filling placed for the purpose of reclaiming land, there has been dumping of all kinds of refuse materials and dead animals. No abuse apparently was thought too great to heap on the stream. It was the natural outlet for drainage, and not only storm water but sewage was discharged into it through public and private sewers. Such treatment naturally caused a very offensive condition, particularly in warm and dry seasons. In periods of low precipitation, the flow of the creek within the city consisted almost wholly of sewage, and septic action was very noticeable in the numerous pools along its course.

In the preliminary plans of the Commissioners of Sewerage an intercepting sewer was planned to take the sewage of the many public sewers discharging into the stream. This has been built, but in times of storm these sewers still overflow into the creek. Only such work as was necessary to drain the stagnant pools was planned to be done on the creek itself.

The improvements on the watershed naturally developed a greater concentration of flow, and the filling of land along the creek caused a loss in storage. With these conditions and the encroachments and obstructions in the channel, floods have occurred with increasing frequency. Not only was this an annoyance and injury to private property, but during the most severe freshets streets and railway tracks were flooded, traffic stopped, and water forced back into the sewers.

During the early part of the work of the Commissioners it was decided to make an exhaustive study of the creek in order to design a comprehensive plan for its improvement. Fortunately, a very heavy storm on Feb. 25-26, 1908, while the investigation was in progress, enabled means of collecting data on flood conditions. From all data available, this flood was the greatest ever occurring on the creek. The rainfall was [illegible] in., according to the recording gage at the office of the Commissioners, and [illegible] in. by the Weather Bureau gage. This was the heaviest fall on record in Louisville with one exception.

This flood was the cause of great damage. Streets were flooded, traffic on the Louisville & Nashville R.R. was stopped and the smaller frame buildings were washed away, basements of dwellings and industrial establishments were flooded. One very important feature of

*Engineering Assistant, [illegible], Louisville, [illegible]

the freshet was the effect on the storm flow from sewers discharging storm water into the creek. Two of the principal sewers of the city were entirely submerged and the water level in the creek rose to a height several feet above the top of the sewers and nearly equal to the elevation of the surface of the ground at many points in the system, and backing into cellars through private drain connections. The intimate relation between the condition of the creek and the efficiency of the sewers, as shown by this freshet, showed very forcibly the importance of an improved channel for the stream.

The investigation resulted in a report on a general scheme for straightening, deepening and widening the channel, and providing masonry walls and floor. The most serious problem was that of adjusting the location of the improved channel so as to conform to existing structures, extensive changes in which would necessitate too great an expense.

The problem of deepening was not particularly serious. At the junction of the South and Middle Forks, the bed was at a sufficiently low elevation, so that along the main stem between this junction and the Ohio River the problem was one of removing elevations in the bed to produce a uniform or at least a continuous grade. The bed of the South Fork was found to be 3 ft. above the invert of the largest sewer discharging into it, and also somewhat above the invert of another large sewer, these being the sewers mentioned as submerged in the great freshet. A further requirement, and the one which determined the grade of the South Fork, was the necessary elevation of an important relief sewer to be built in the future. The maximum depth below the old creek elevation required for these storm-water sewers was about 7 ft., excavation for which would be largely in rock.

The line of the creek was found to be largely controlled by the many railway and highway bridges. These influenced the stream in three ways: by acting as obstructions, by causing bends in the course of the stream, and by narrowing the channel. The chief offenders of the first class were the trestles, carrying spur tracks of the L. & N. R.R., and it was considered that these should be replaced by plate-girder bridges, but after conferences with the railway company, industrial tracks were built to parallel the creek on the opposite side from the main track, thus obviating the necessity of any spur-track bridges. The elimination of one of the plate-girder bridges was made possible by the closing of the street which passed over it. In the design of the improved channel, the waterway provided was to be clear without piers or other obstruction.

The location of the bridges was not, in the main, unfavorable to the course of the stream. In two cases, however, in which the main line of the railway crossed the channel on plate-girder bridges, it was found necessary to relocate these as skew bridges of longer span and on a different location. One of the largest and most expensive bridges, a stone arch carrying a street with very heavy traffic, was built at right angles to the street, although the general course of the stream was at a considerable angle with the street. On account of the expense of building a new bridge, the line of the creek was curved on either side of the bridge to conform to its location.

The most serious trouble to be found with the bridges was the insufficient width of waterway provided. Fortunately, it was possible to increase the grade of the creek through the localities where the bridges were most frequent, which made it possible to design a waterway which would be theoretically sufficient at nearly all points. The location of the improved channel is shown as Fig. 1.

The Improved Channel

The improved channel for Beargrass Creek was designed for a runoff of 185 cu.ft. per sec. per sq.mi., for the South Fork and 180 cu.ft. for the creek below the junction of the South and Middle Forks. An increased depth beyond the 9 ft. assumed in the design would increase the discharge to 200 cu.ft. per sec. per sq.mi. or more without damage to surrounding property.

The design provided for concrete-masonry walls and floor (Fig. 2) shows the typical section, southwest of Baxter Ave. For about 7500 ft. from the river, the channel was designed to have a width of 70 ft., with side walls 4 ft. above the floor and banks graded to a slope of 1 on 2. The floor is depressed at the center 3 in. below its elevation at the side walls, and has a small channel 11 ft. wide and 9 in. deep to carry the dry-weather flow. From the upper end of the 70-ft. channel to the junction of the South and Middle Forks (a distance of 580 ft., within which five bridges were to be passed), the grade was increased and the width reduced to 15 ft.

For the first 2500 ft. on the South Fork, there was room for any desired width of channel, and there was but one bridge. The width selected was 50 ft., narrowed at the bridge to conform to its width. For a distance of 1500 ft. above this section, the available room was very limited although a steeper grade was possible, so that the width was made only 40 ft. The walls varied in height from 4 to 24 ft., according to the elevation of the abutting land, the use to which it was put or its value, and the possibility of sloping the banks. The accompanying table shows the sizes of channel, velocity of flow, discharge, etc.

Distance, ft.	Channel width, ft.	Grade, per cent.	Velocity, ft. per sec.	Discharge, cu. ft. per sec.	Capacity, cu. ft. per sec. per. sq. mi.	
7500	70	0.20	18.2	11,800	180	Main Stem
580	45	0 40	24 1	10,070	183	" "
2575	50	0.80	10.95	5,070	184	South Fork
1270	40	0 14	13.9	5,150	187	" "

In all sizes, the depth of flow is taken at 9 ft., that being the elevation at which it was desired to limit the flow under all but extreme conditions. During the great floods in the Ohio River, back-water from the river will stand at an elevation much higher than this.

In explanation of the high velocities shown in the table, it may be stated that an examination of the inverts of old storm-water sewers in the city indicated that the material carried by them had but little effect on the masonry. The only case in which a measurable scour was found was in a sewer built over 50 yr. ago, in which the theoretical velocity was 26 ft. per sec., and the invert brick had lost but 1/4 in. by erosion. In hardness tests made with a machine of the Dorry type, samples of concrete made with Ohio River gravel (1:2½:5) showed wearing properties superior to those of brick from the Louisville sewers. In fact, the concrete was found to compare very favorably with samples of street-paving brick.

This absence of wear in the old sewers may be due to the nature of the mineral matter carried in these sewers. The detritus from street wear in the macadam streets is composed principally of the fine limestone dust

resulting from the material of which the streets were [illegible]. The detritus from a macadam street built of a harder material would undoubtedly have caused a greater scour. The abrasion from granite and vitrified-brick pavements is apparently too small in amount to cause [illegible] wear on the sewers.

Some observations by the Reclamation Service [illegible] ("Safe Velocities of Water in Concrete," Engineering News, Jan. [illegible]) indicate that in the absence of gritty matter, concrete is able to withstand very high velocities of water. The watershed of Beargrass Creek having for nearly its whole area a [illegible] surface soil, the storm flow has a very high turbidity but the matter held in suspension is not of a gritty nature. In the future, when the creek is improved throughout its length in the city, and the upper areas are developed so as to increase the runoff and develop the theoretical velocities, the sloping earth banks above the tops of the low walls will need protection. For the present, high velocities will be diminished by the retardation of the flow due to the lack of improvement in the lower reaches of the creek.

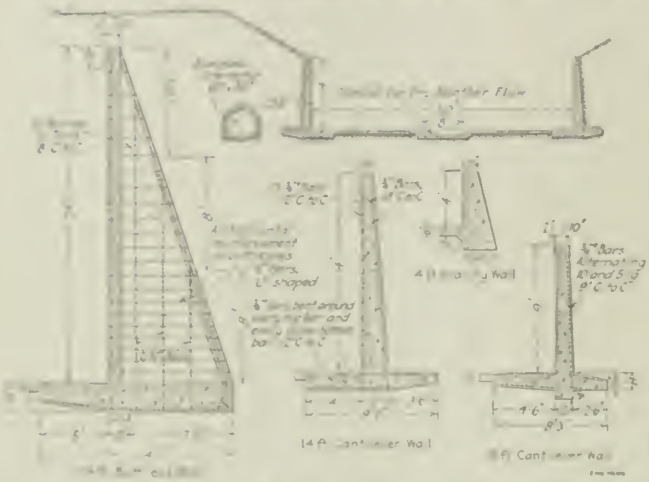

FIG. 2. CROSS-SECTION OF BEARGRASS CREEK CHANNEL AND TYPICAL SECTIONS OF THE RETAINING WALLS

Although the line of the improved channel was made as direct as possible, changes in direction were necessary at the various bridges and also to a slight extent on account of topographical features. All changes in direction were made with curves and the channel lines were made tangent to the lines of the bridges (Fig. 1). The minimum radius used for the center line was about twice the width of the channel. This short radius was used in one instance only and then from necessity on account of existing structures. That this curve was sharper than desirable was shown by the fact that a deposit was formed on the inner side of the curved channel after a heavy freshet.

The studies on the best type of wall for the channel resulted in the selection of the gravity type for the 4-ft. walls, the reinforced-concrete cantilever type for walls 9 ft. to 14 ft. high, and the buttressed or counterfort type for the 24-ft. walls (Fig. 2). The changes in height from 4 ft. to 9 ft. were made with a sloping wall of the gravity type, and from 9 ft. to 24 ft. with a sloping wall

FIG. 3. CONSTRUCTION OF THE CONCRETE CHANNEL OF [illegible] CREEK, SOUTH OF BAXTER AVE. BRIDGE, [illegible] (30 FT. WIDE; WALLS 14 FT. HIGH)

of the cantilever type. As it was decided to construct the floor of masonry, it was thought wise to utilize the toe of the wall as a part of the floor. For this purpose, the base was set farther to the front than is commonly done. This design lessened the amount of excavation and of concrete masonry. The floor was designed of masonry to obtain a smooth surface for the sake of capacity and to facilitate the cleaning of the bed of the creek when it should become necessary. The floor was designed

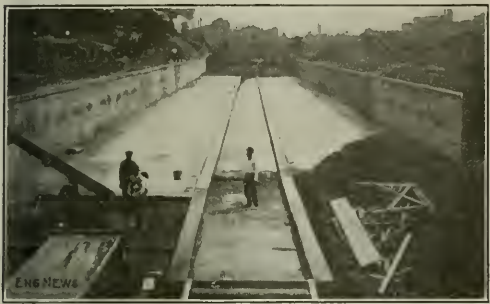

Fig. 4. A Completed Section of the Beargrass Creek Channel (South of Junction with the Middle Fork)

with a thickness of 6 in., but during construction this thickness was reduced (where rock was encountered) to a minimum of 2 in.

The Commissioners of Sewerage were directed originally to construct a comprehensive system of sewers, and no more work was contemplated in the preliminary plans than a slight improvement in the grade and the removal of obstructions in the bed. As the importance of a substantial improvement became more apparent, the situation was studied to determine the value of a partial improvement. As a result, it was decided to construct about 2700 ft. of the channel complete with masonry walls and floor. About 400 ft. of this was built to facilitate the construction of a section of the intercepting sewer at the side of the creek.

Fig. 3 shows the work under construction just south of Baxter Ave., where the walls are 14 ft. high. In the center of the view is a length of the form for the wall, while at the left is a completed stretch of the opposite wall, with form being erected for another section. Fig. 4 shows a completed stretch of the improved channel, south of the junction of the Middle Fork. This shows clearly the arrangement of the floor slabs on either side of the central channel, with a chute for depositing concrete at the left. Fig. 5 shows an interesting view on the completed work.

Construction Work

On account of the uncertainty of determining in advance the cost of the work, which was nearly all to be done in the existing bed and subject to serious delays and damage by flows in the creek of all degrees of intensity, and by floods in the Ohio River, it was decided to perform this construction by day-labor. A day-labor force had been organized under F. C. Williams, Resident Engineer, for certain sewer construction on which the contractors' bids were considered unduly high. This force had been very successful with the previous work and was well organized for the creek construction. Another advantage of the day-labor system was the ease with which the amount of work to be done could be adjusted to suit the amount of funds available. This was desirable as this work was postponed until near the end of the construction of sewers. The total expenditure for the creek was about $170,000, which was less than the receipts from interest gained through the good management by the Commission of the $4,000,000 bond issue. The expense of the investigation and construction together was met out of the surplus above the face value of the bond issue.

The construction work was facilitated by the use of the intercepting sewer built in the valley for the disposal of the flow of water in the creek in dry weather. By this means, all but a small amount of water was avoided, except at storms, in the majority of the work. At the junction of the South and Middle Forks, a sand-bag dam was used to divert the flow into the sewer. At two points where the new channel was built on a new location, and where the excavation was between 9 ft. and 24 ft. deep, the earth (20,000 cu.yd.) was removed by contract; in one instance, by wheel scrapers and in the other by steam-shovels and teams.

The work of construction as a whole was of such a nature that the use of extensive equipment was not warranted. A traveling derrick with buckets and small steel

Fig. 5. The Beargrass Creek Channel, Louisville, Ky.

(Just below junction of the South and Middle Forks, with three railway bridges.)

dump-cars were used to move earth and rock excavation by the day-labor force, and these with a concrete mixer and a number of light drills operated by steam comprised the total equipment in addition to small tools. With the exceptions noted above, the excavation was, to a large extent, of slight depth and was moved with pick and shovel either with or without the use of the derrick. The excavated material was deposited back of the walls and used in raising the level of land in the immediate vicinity of the channel. In order to prevent the pressure on the walls from a heavy fill of mixed rock and earth, the rock was carefully deposited or piled so as to be self-supporting, so that it would relieve rather than add to the pressure on the walls.

Excavation beneath the bridges was necessarily car-

ried on with extreme care, particularly where rock was encountered. [illegible] limestone bridge, the excavation of 4 ft. of rock was required. Blasting was done at the center with light charges of dynamite, and [illegible] holes were drilled as close as possible to the abutments, but no dynamite was used in holes less than 6 ft. from the abutments. The rock at the abutments was trimmed off with [illegible]. Although no signs of weakness were apparent in the arch, the excavation revealed a very poorly constructed foundation, the abutments resting on large [illegible] on the bed of the creek. The bridge masonry was carefully underpinned not only to prevent settlement in the structure but also to secure it against erosion. In another old limestone arch, immediately below the junction of the South and Middle Forks, the bed of the stream had been eroded nearly to the extent of endangering the bridge abutment. At this point, the bed required filling in order to raise it to the proper elevation for the masonry floor.

Expansion joints were designed to be placed at the joints between the toe of the wall and the floor, and between the floor and the center channel. Transverse expansion joints in the wall and floor were required at a maximum distance of 30 ft., but as built, an expansion joint was used at the end of each section, which, in the case of the lower walls, was 15 ft. The 24-ft. wall was built in independent sections 30 ft. long, with expansion joints at the ends. These joints in the walls were made of layers of tarred paper coated with pitch. The joints in the floor were generally made by pouring pitch into the space left by the removal of thin boards or shingles temporarily placed along the planes of the joints at the time of placing concrete. The expansion joints were varied in thickness, according to the season, those placed in winter being much thicker than those placed in summer.

Drainage of the material behind the wall was provided by a 4-in. pipe laid continuously back of the wall, with [illegible] outlets through the wall to the channel at intervals of 30 ft. or less. The backfilling immediately behind the wall was of selected porous material.

Some consideration was given to the necessity of reinforcing the cantilever and buttressed walls against pressure from the channel side, on the assumption of a channel filled by a freshet before the earth pressure back of the wall was developed. But as water in the channel would find its way to the back of the wall at an equal height [illegible] around the back of the walls, this [illegible].

Although the work of the Commission covered a length of only [illegible] ft., it accomplished a [illegible] reduction in the height of the flood waters. A storm of [illegible] occurred near the close of the work which demonstrated the value of the work done. Although it had a greater total precipitation and greater intensity than the storm of [illegible], it caused little or no damage. [illegible]

Since the completion of the work of the Commissioners of Sewerage, the improvement has been taken up and continued by the city through its Board of Public Works. This work, covering a length of nearly 5000 ft., has followed in general plan, the scheme of the Commission.

J. B. F. Breed was Chief Engineer, and Harrison P. Eddy, of Boston, Mass., was Consulting Engineer of the Commissioners of Sewerage.

Lamp Signals for Day Service on Electric Railways

An interesting development in the introduction of block-signal systems for interurban electric railways is the use of lamps for both day and night indications, thus dispensing with semaphores and their operating mechanism and simplifying the signal equipment very materially.

Two daylight lamp signals are shown in the accompanying cut; the one at the left is on the Indiana Union Traction line and the other is on the Terre Haute, Indianapolis & Eastern Traction line, both being of the "absolute-permissive" automatic block system of the General Railway Signal Co. There are three lights in each signal, the two upper lights constituting the main signal, while the bottom light is the permissive indication which practically subdivides the block for following movements and enables trains in the same direction to run at closer intervals than the distance between passing sidings (this distance being the length of the main block). The visibility of each light by day is increased by a hood projecting over the top and side of the lens, as shown.

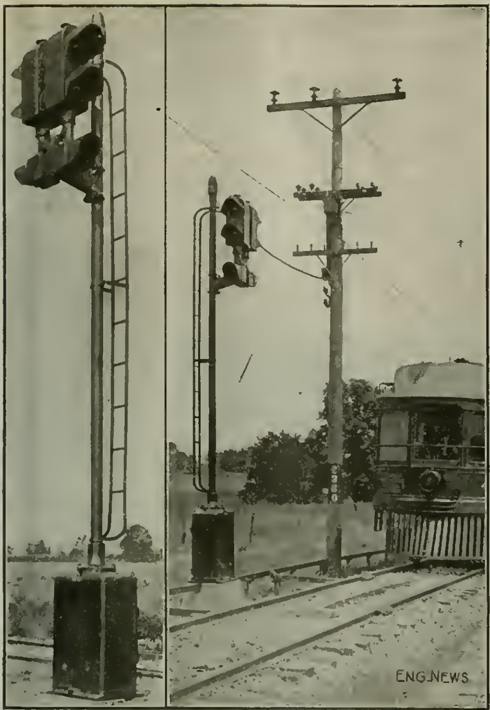
The development of this type of signal is reviewed in the report of the Joint Committee on Block Signaling, presented at the recent annual meeting of the American Electric Railway Association. A condensed abstract of this part of the report is given below.

The first installation of signals constructed on correct principles for both day and night service was in 1907 on the Brooklyn Bridge, by the Union Switch & Signal Co. These signals had 5-in. lenses giving both green and red indications and were equipped with [illegible] hood but were not provided with any artificial background. Two 16-cp. lamps were mounted behind each lens. In 1911 short range light signals for daylight conditions were installed in the Pennsylvania [illegible] in New York by the same company.

The use of light signals on high-speed interurban lines having continuous track circuit control is of recent origin and the first trial was made on the Michigan United Rys. in February, 1911 by the General Railway Signal Co. This was a temporary signal mounted in a wooden case and arranged so that either [illegible] or [illegible] red and green lenses could be used. The 110-volt [illegible]-watt tantalum lamps were [illegible] so that the [illegible] of the lamp [illegible] was directly behind and [illegible] with the focus of the lens. [illegible] Energy for the lights was taken from the [illegible] and cut down to [illegible] by resistance. It was found that with the sun shining directly into the face of the signal the red light could be seen about [illegible] ft. and the green light about [illegible] ft.

In 1911 the above company installed a light signal on the line of the Lehigh Valley Transit Co., near [illegible] Valley, [illegible]. This was in connection with an installation of [illegible] signals for the purpose of comparing the suitability of the light signal for interurban service; but it was finally taken out and replaced by a semaphore in order to have all signals uniform.

Long range signals of this type were installed by the Union Switch & Signal Co. on the [illegible] Washington, Baltimore & Annapolis Electric Ry. in 1911. They were of the type installed in 1907 on the Brooklyn Bridge, except that the hood length was increased to [illegible] in. and a shield extending [illegible] in. on each side was added to form an artificial background. Each signal had two lenses, one red and one green, and behind each were mounted two [illegible] 16-cp. tungsten lamps wired in multiple. No [illegible] were employed, so that indications could not be affected by headlights. The use of [illegible] lenses without [illegible] and the white light



LIGHTS AS BLOCK SIGNALS FOR DAYLIGHT INDICATIONS

(The lights are hooded to increase their visibility and to screen the lenses from direct rays of sunlight [and headlight]. The signal at the left is one on the Indiana Union Traction System, and that at the right is on the Terre Haute, Indianapolis & Eastern Electric Ry.)

of the tungsten lamps so improved this signal as to provide suitable indication at 1600 to 1800 ft. under the most severe daylight conditions.

The first complete signaling installation with light signals throughout was on the Brazil Division of the Terre Haute, Indianapolis & Eastern Traction Co.,* and was completed and put in operation in the early part of August, 1912, by the General Railway Signal Co. An installation on the Indiana Union Traction System,* by the same company, consisting of 29 blocks of light signals which protect 50 miles of track, has (according to the company) proved entirely satisfactory, although at first the continuous track circuit gave trouble from dirty rails in paved streets. Since the cause has been recognized, this trouble has not interfered with operation.

These signals have 40-watt lamps, and 8-in. lenses with hoods, and in daytime the signal indications can be read clearly at 3500 ft., and at night on the longest tangent, 2.05 miles. This installation has been in service since 1912 and so far there has been but one false clear indication given by the signals, and it is doubtful if this could be charged against the signals. No difficulty has been experienced in picking up signals, and phantom indications (due to arc headlight reflection) have not so far been given, nor has the continuity of operation been affected by heavy sleet storms experienced in the winter of 1913. So far as operation and cost of installation are concerned, the light signal is the equal of the semaphore. No complaints have been received from the trainmen with regard to these signals.

The Illinois Traction System, although having the majority of its signals of the semaphore type, has some light signals and believes that the light signal is of advantage because it can be read a greater number of hours during the average day of operation.

The one all-important feature of light signals is the correct reading of the indication, and while in most cases the lenses are hooded to shade the rays of the sun and headlights, it is said that with an 8-in. lens a layman can read the indications at 2000 ft. and a motorman at 2500 ft. Recent tests at New Haven have shown that with existing types of light signals using 15-watt lamps, indications were distinctly visible 1500 ft. distant. These signals had 8-in. lenses, and it is said that if they had been equipped with 10-in. lenses, the indications in the daytime would have been visible at 3500 ft.

The committee submits what it considers to be good practice in regard to sizes of lenses for use with light signals: (A) For high-speed interurban service, a lens of not less than 8⅜-in. diameter should be used on all light signals operated by continuous track circuits. (B) For moderate-speed roads, a lens of not less than 5⅜-in. diameter should be used where light signals are operated by trolley contact or other end set devices.

*The signals of these two installations are shown in the accompanying cut.—Editor.

Large-Sized Stone for Bituminous Macadam in Ohio

A part of the $7,500,000 of contracts let by the Ohio State Highway Department in 1914 was for roadway having a top course of bituminous macadam, built by the penetration method. The broken limestone used for this top course was from 2½ to 4 in. in size. The general specifications under which this work was done, after stating how the stone should be spread and then rolled to a firm and even surface, continued as follows:

Where this top course is thicker than 3 in. after rolling, the bottom voids up to within 2½ in. of the surface shall be filled with coarse sand, or screenings, as the Commissioner may direct. Each shovelful of screenings shall be applied thinly over the surface and the rolling continued as the screenings are being applied.

After the top course has been rolled and completed as specified above, the voids in this course shall be partially filled with screenings, free from dust, that will pass through a ¾-in. and over a ¼-in. circular mesh, which shall be whipped into the surface from shovels. The surface shall then be gone over with a stiff fiber broom, and the loose screenings remaining on the top swept into the voids, or off the surface. When deemed necessary the rolling shall be continued during the application of the screenings. The filling of the voids in this top course shall be such that the amount of bituminous material specified shall fill the remaining voids just sufficiently to produce a dense surface when the road is completed. Any dust remaining on the surface shall be removed by sprinkling with water. Sufficient time for the stone to dry shall elapse before any bituminous material is applied.

The hot bituminous filling, either tar or asphaltic, was applied at the rate of 1¾ gal. per sq.yd. The surface was then dressed with "hard, clean screenings of stone, slag or gravel, ¾ to ¼ in. in size, and rolled until firm." Finally a seal coat of ½ gal. per sq.yd. of the same bituminous material, heated, was applied, more screenings added, the roller used, and then a final dressing of screenings was applied "to protect the surface of the road while setting up."

James R. Marker is State Highway Commissioner of Ohio, and C. E. Schoenmaker is Deputy Commissioner for Construction.

Steel Railway Ties are likely to be largely substituted for wooden ties on Indian railways, according to the government report on Indian Railways just issued. Both steel and cast-iron pot sleepers have been used in India for many years with a fair degree of success, but have hitherto been found expensive in comparison with wooden ties. The diminishing supply of timber with the steady increase in price has changed conditions, and it is stated that the use of metal ties will probably be greatly extended in the next few years. The government is also experimenting with various processes of treating timber ties to increase their life and preserve them from the attacks of white ants, and has asked for bids for the supply of wooden ties so treated.

Vitrified-Brick Pavement on an Old Macadam Base, Carlisle, Penn.

By John C. [illegible]*

During the past season [illegible] sq.yd. of vitrified-brick pavement were laid by the Street Department of Carlisle, Penn., under the supervision of the writer.

Track Section—The section paved comprised [illegible] on High St., the main business street, through which the tracks of the Cumberland Valley R.R. run. The railroad company was unwilling to pave between and along the tracks, but it agreed to construct a concrete curb, [illegible] supported the 5x8-in. by 16-ft. guides for a striking template.

Concreting Fills in Trenches—The Gas & Water Co. had recently renewed a great many trenches along the street, and poor foundations existed in the old gutters, so it was deemed advisable to fill all these new trenches and the gutters with concrete 5 in. deep.

Stone Cushion—The cushion was composed of limestone dust and screenings, 1½ in. in thickness, and was struck off by means of a short striking template drawn by three men, as illustrated in Fig. 1. The cushion was then rolled with a 250-lb. roller drawn by hand.

Laying Bricks—The bricks were laid by one foreman and two men, one of the men breaking half-brick to fill

Figs. 1-4. Construction of a Vitrified-Brick Pavement on an Old Macadam Base

(1) [illegible] (2) [illegible] (3) Laying brick. (4) Rolling

[illegible]

Pavement [illegible]—The old macadam with which the street was paved was used as a base for the new paving. This macadam had a double [illegible] crown of [illegible]

[illegible]

[illegible]

*[illegible], Carlisle, Penn.

[illegible] Usually there were [illegible] [illegible]. An average of 7000 bricks were laid by each man per day. Vitrified shale paving blocks were used.

[illegible] Rolling was done with a [illegible]-ton [illegible] roller [illegible]

Grouting—The joints were grouted with a 1:1½ portland-cement grout.

Expansion Joints [illegible] "Elastite" [illegible] joint was used longitudinally along the [illegible] and [illegible]

"Elastite" was found to be a great improvement over the [illegible] joint filler, doing away with the

[illegible]

boards, wedges, heating the pitch, etc., and the first cost of the joint was practically the entire cost, as it took very little time to place it in position.

SAND COVERING—The green pavement was covered with ½ in. of sand for several days. Traffic was turned on the pavement at the end of five days.

COST DATA—The following is an itemized list of cost data:

	Total	Cost per Sq.Yd. of Pavement
Unloading and hauling brick	$193.74	$0.0777
Grading and rolling subgrade	280.73	0.1126
Concreting trenches	211.36	0.0848
Crushed stone cushion	135.50	0.0543
Brick	2143.98	0.8600
Laying brick	93.85	0.0376
Rolling brick	15.64	0.0062
Grouting	210.72	0.0845
Expansion joints	88.75	0.0356
Covering with sand	11.74	0.0047
Total	$3386.01	$1.358

Dump wagons were charged at the rate of 10 and 15c. per hr. The reason for this was that they were fire teams; one

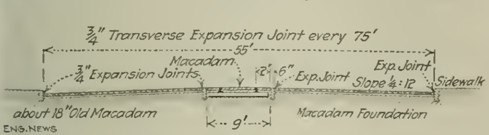


FIG. 5. CROSS-SECTION OF BRICK PAVING ON AN OLD MACADAM BASE, CARLISLE, PENN.

was paid 10c. per hr.; for the use of the other the Street Department paid the driver's salary, which was $1.50 per day, or 15c. per hr.

The bricks were purchased in March at a reduction of $1 per M. The great advantage in this was that we got a better run of bricks and had them when needed, and we saved $1 per M, or $100 on the year's work.

All macadam excavated was used in resurfacing streets adjacent to the work. Approximately 20,000 sq.yd. were thus resurfaced.

It will be noticed that a stone cushion was used instead of sand. The reason was that when first tried as an experiment the stone formed a compact cushion without becoming too solid, and at the same time reduced the cost by one-half.

A Dinner Party in a Boiler Furnace

The huge Stirling boilers installed in recent years at the Del Ray plant of the Detroit Edison Co. have attracted wide attention in the engineering profession, being by far the largest boiler units ever constructed and having attained a phenomenally high efficiency, together with a capacity to be operated at several times their normal rating.

A new boiler of this type has recently been installed at the Connors Creek plant of the Detroit Edison Co., and to celebrate its completion a dinner party was given inside the furnace of the boiler on Saturday evening, Nov. 28, at which 46 guests sat down. There was ample room inside to have seated at least a dozen more people with comfort.

Those present at the dinner were the officers and directors of the Detroit Edison Co., with their wives, the members of the construction force, and a few guests present by special invitation. Mr. Alex Dow, President of the Detroit Edison Co., is the central figure in the group. To prepare the boiler for the festal occasion, a wooden floor was built over the stokers and the tubes overhead were concealed by festoons of ribbon.

The boiler is rated at 2355 hp., but it is capable of furnishing sufficient steam for the development of 10,000 kw. of current by the turbine generators. The approximate exterior dimensions of the boiler are 30 ft., depth, width and height.

The boilers were built by the Babcock & Wilcox Co.

DINNER PARTY INSIDE THE FURNACE OF BOILER NO. 2, CONNORS CREEK PLANT, DETROIT EDISON CO., NOV. 29, 1914

A New Species of Engineer is reported from England, where a firm advertises in the London "Times" as "Laundry and Cooking Engineers." What is doubtless meant is that the firm in question specializes in the design and installation of machinery for use in laundry and large culinary establishments in hospitals, hotels, etc. There is no apparent reason why the design and installation of such machinery is not as legitimate a field for an engineer's expert services as the design of machinery for power development or for cutting metal, but it is doubtful whether in this country, at least, such designers and constructors have risen to the dignity of separate nomenclature.

Field and Office

Lowering a Submarine Pipe by Piledrivers

An interesting piece of submarine pipe laying recently completed was the laying of a 16-in. main across the west branch of the Chicago River in Chicago (near Hoyne Ave.) for the International Harvester Co. The purpose was to extend the high-pressure fire-protection system from the main plant on the north side of the river to the binder twine and other parts of the plant on the south side. The

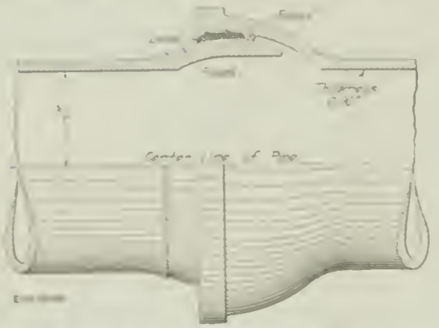

FIG. 1. FLEXIBLE JOINT FOR SUBMARINE PORTION OF HIGH-PRESSURE FIRE-PROTECTION MAIN AT CHICAGO

river is about 200 ft. wide, and the pipe is laid 25 ft. below the water surface.

About 20 ft. of dock was removed on the north side of the river and a dipper-dredge cut it then dug a trench across the river to a depth of 25 ft., carrying the excavation well back of the dock line on either side of the river to receive the inclined portions of the submarine main. Some hard digging was encountered in the lower part of the trench, though the upper part was of slushy material.

The main, 16-in. inside diameter and about 225 ft. long, was of heavy cast-iron pipe for a working pressure of 100 lb. per sq.in. It was made up in the usual 12-ft. lengths, but with the special flexible joints shown in Fig. 1. It was assembled in horizontal position on two deck scows, falsework being erected at the extreme ends of the scows to receive part of the inclined portion of the pipe.

The two scows, with pipe assembled, were floated to a convenient dock on the river, and four floating piledrivers were placed alongside. Four sets of bridles, made of 1-in. cable, were lashed to the pipe and fastened to the pulling blocks in the leads. (Although the piledrivers were fitted for much heavier lift, the pipe was handled on the pulling blocks as it was thus more easily manipulated.) The pipe was then lifted off the scows and hung on the leads. The scows were removed and the drivers swung around in position for lowering the pipe, as shown in Fig. 2. This operation required careful manipulation of the lines to get and hold the piledrivers in position.

The pipe was lowered in the water about 8 to 10 ft. and held there while messenger lines were put out from the leads of the end piledrivers, and additional lengths of pipe were set in place at each end (to lengthen the inclined portions). These joints were made with lead gaskets. Then the pipe was lowered about 8 ft. more and the ends again lengthened, until finally the main was in position in the bottom of the trench. The diver had trouble in releasing the bridles from the pipe on account of the amount of slush that had run into the trench.

When the pipe was in place, it was tested under hydraulic pressure at 150 lb. per sq.in. The dock wall at

FIG. 2. LAYING A SUBMARINE PIPE IN THE CHICAGO RIVER BY MEANS OF PILEDRIVERS

([illegible])

the north side was then reconstructed, and connection was made to the pipe systems on both sides of the river. The work was done last summer by the Great Lakes Dredge & Dock Co., of Chicago.

A New Sampling Outfit for Bacterial Samples

By Robert Spurr Weston*

Frequently bacteriological samples of water, sewage, milk, etc., must be collected during warm weather. At such times it is necessary to transport them to the laboratory under conditions which as far as possible will prevent growth. For this purpose, many engineers and analysts have packed samples in ice, or in ice and saw-

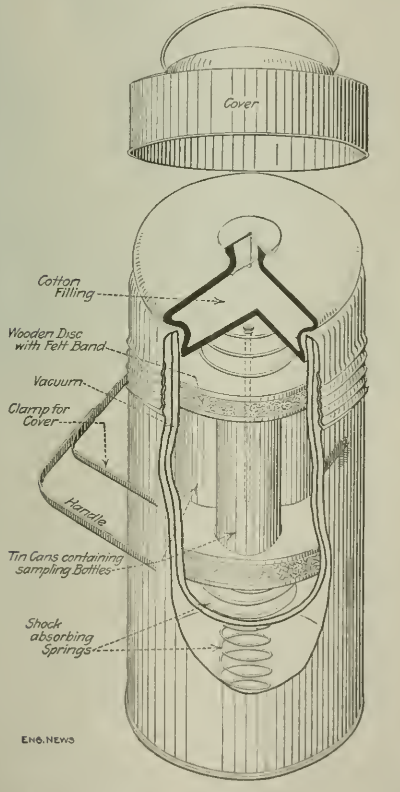

Fig. 1. Vacuum Jar for Use in Collecting Samples for Bacterial Examination

dust. Recently, there has come into use a device based on the fireless-cooker principle, which, though very satisfactory, is rather large, especially for a small number of samples, and, on account of its weight, costs a good deal to ship by express.

Recently the writer has made use of vacuum jars of various sizes with success. These can be arranged to hold from one to eight of the ordinary 2-oz., salt-mouthed, glass-stoppered bacterial sample bottles, inclosed in screw-capped tin cases. The following is a description of the outfit for three samples.

The isometric sketch, Fig. 1, shows the arrangement of the parts, and the view, Fig. 2, shows the parts separately. In a stock quart "Hotakold" jar is placed a holder for three tin cases. This holder consists of two disks of wood or metal with a band of felt at the edge so that the disks will make a loose fit with the sides of the jar. The disks are provided with circular depressions for receiving the bottoms and tops of the tin cases and a brass bolt with a thumb nut is used to secure them in place. By loosening the nut, the cases can be quickly removed from the holder. The holder moves freely within the jar, and is held in position by two springs at top and bottom respectively.

When shipped by express, the whole outfit can be placed

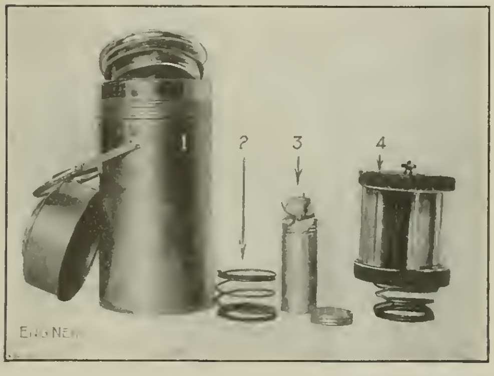

Fig. 2. Parts of Outfit for Collecting Bacterial Samples

(1) Vacuum jar, with metal cover removed and vacuum cover lifted. (2) One of the shock-absorbing springs. (3) Tin case and screw cover with the top of the sample bottle sticking out; the bottle is covered with the usual cloth cap. (4) Holder, with two cases containing bottles in place.

in a willow basket or a box. It is a very convenient apparatus to carry around, and may be covered with a cloth bag or leather case. A few lumps of ice placed in the bottom of the jar keep the samples at a low temperature for hours.

The apparatus above described weighs only 6 lb.

Building Gravel Roads in Logan County, Illinois

By John I. Miller*

We start the construction of a gravel road exactly as we would the improvement of a dirt road. Of course, the most essential thing is thorough drainage both by tiles, if necessary, and by shaping and crowning the subgrade exactly the same as if it was to be the wearing surface. With such a base for the gravel, water will not lie on the surface of the road at any place or in the side ditches.

First Gravel Coating—The next step is to haul the gravel and place it along the center of the road, about 1 cu.yd. to 10 or 12 lin.ft. of road, or 528 loads per mile. In Logan County, the gravel is generally donated by generous land owners, and this first layer does not cost more

*Consulting Sanitary Engineer, 14 Beacon St., Boston, Mass.

*Commissioner of Highways of East Lincoln Township, Logan County, Lawndale, Ill.

than $[illegible] per mile for hauling. The gravel is then left as is, spread and beaten down by traffic. It will slowly be shaped into a smooth, even surface—about two years' time is required.

SECOND GRAVEL COATING.—When the first layer has become compacted, we follow this course with another, using the same amount of material, also leaving it to be spread and compacted by traffic. At the end of another year, the road is hard and compact and usually of a width of about 14 ft. The cost of this kind of a road seldom exceeds $640 per mile, but this does not include all of the cost, because of material and labor donated, as above stated. Charging the value of the donations, the cost would probably be 25% more.

MAINTENANCE—The continual upkeep of this kind of a road is only nominal. The regular four-horse "King" drag is all the equipment which will be necessary. There may appear "spring" spots where water collects at the surface, or a hole may appear where the gravel has sunk into the subgrade. These are promptly repaired by dumping one or more loads of gravel on these spots, or as much gravel as experience shows to be necessary.

My experience has been that such a gravel road as the one described is a great favorite in the black muck fields of Logan County and is so reasonable in cost that we may improve at least 10% of our roads per annum.

Razing a 400-Ton Brick Chimney

The construction of tall chimneys has from time to time been discussed in engineering publications, but little has ever been written about the most efficient method of chimney destruction.

An interesting work of this character was performed in San Francisco on Oct. 24 last.

Immediately after the San Francisco earthquake of 1906 the cable street railways of the United Railroads were converted into electrically operated lines. This led to the abandonment of numerous steam plants which had been used to operate the cable roads. Among these was the power house situated on McAllister St. between Central and Masonic Ave. The brick chimney for this plant was originally 155 ft. in height with a square base 14x14 ft., 12 ft. in height, surmounted by a circular radial superstructure that tapered to a diameter of 10 ft. at the top. It was built 30 years ago. The quake of 1906 shook off the top a 25-ft. section. It was calculated that the 100-ft. section still standing weighed 400 tons.

Fig. 1. [illegible] Chimney, Showing Direction of Fall

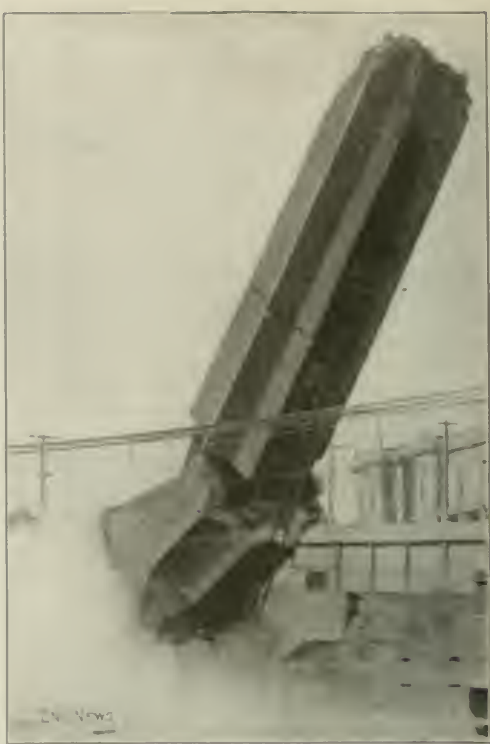

Fig. 2. Razing a 400-Ton Brick Chimney, San Francisco, Calif.

As the city expanded and the vicinity of the power house developed into a residential section, the unsightly ruined stack with its fractured top was regarded as a disfigurement to the neighborhood, and the street railway company was asked by the residents to remove the structure. Accordingly the chimney was razed in the following manner:

It was desired to throw the chimney along a line approximately N. 60° E., in order to parallel the tracks of the present electric road, which ran in that general direction at a distance of about 40 ft. from the base of the chimney. A section 2½ ft. in height extending through the chimney to the east of its center, in the direction shown on diagram, was removed with jacks from the base of the chimney. Some [illegible] by 2½-ft. pine blocks were loaded at the ends with two vertical sticks of dynamite, one 8½ in. long in the top and another 4½ in. long in the bottom. The fourteen caps that were to discharge the dynamite were connected by wire so that the charge could be set off by electricity. The loaded and [illegible] blocks were then placed vertically in the aperture [illegible] through the walls, and the blast was fired. Due to the opening for the doorway in the south wall, the chimney fell almost due east. In falling it separated into three sections, as shown in the accompanying photograph. On striking the ground these shattered, the frag-

ments all being thrown forward in the direction of the fall, for a distance of about 200 ft. from the base of the chimney. A few reached the tracks of the adjoining line above referred to, but were removed and traffic resumed in less than five minutes.

The razing of the stack was performed under the direction of B. P. Legare, Chief Engineer of the United Railroads.

Special Outrigger for Driving Piles under Trestles

A special outrigger designed for putting down piles in restricted quarters or where it is desired that the piles be inclined in any direction, was used in building the pier footings for the new steel bridge of the New York & Long Branch R.R. (C. R.R. of N. J.) across the Shrewsbury River, at Red Bank, N. J. The device consists of a movable steel frame pivoted on an ordinary piledriving machine, at about two-thirds the height of the leads (Fig. 1). The frame can be inclined in any direction by means of the pivot shown in detail (Fig. 2).

The driving is done by an ordinary ram whose rigging is simple: The line is run to a pulley at the top of the frame and down under another pulley near the pivot, thence leading back to the hoisting engine. Of course, a steam hammer could just as easily be hung in the channel ways. A battered group of piles, 16 ft. in diameter at low water, can be driven without moving the float.

The new Red Bank bridge was built partly under an old two-track wood trestle (the first half taken down was 20 yr. old; the second half, 40 yr.), one track of which was continued in operation. The contractor was not allowed to use this structure either in handling material or as a base for his plant equipment. This difficult condition led to the development of the rig described.

The outrigger was designed by John Anderson, contractor, 90 West St., New York City. When the rig was used on the Red Bank bridge, Mr. Anderson was general superintendent for G. B. Spearin, New York City.

(Detail in upper right shows method of pivoting frame to stationary structure.)

A Large, Long Reinforced-Concrete Flume of Catenary Section

The following interesting description of a remarkable irrigation flume, with cogent reasons why a flume instead of a siphon was used, and why a catenary section was adopted, is taken from an address by H. B. Muckleston, Assistant Chief Engineer, Department of Natural Resources, Canadian Pacific Ry., delivered before the recent International Irrigation Congress at Calgary, Alberta. The flume is a part of the eastern section of the Canadian Pacific Ry.'s immense irrigation system southeast of Calgary.* We quote from Mr. Muckleton's paper as follows:

FIG. 1. SPECIAL RIG DRIVING PILES UNDER A TRESTLE, AT RED BANK, N. J.

The outlet at the north end [of the large storage reservoir] supplies the Bantry canal system, which irrigates 120,000 acres. About four miles from the reservoir this canal comes to a cross valley, and here was met the toughest engineering problem encountered in the design of the whole system. It was required to convey 900 cu ft. of water per sec., or 330,000 gal. per min., across a valley two miles wide and 60 ft. deep, crossing the main line of railroad on the way, and do it with as little expense as possible, coupled with the least loss of elevation. The solution of the problem has resulted in a structure which has no parallel on this continent, or anywhere else.

In cases of this kind there is always the choice between a flume and a siphon, and the designer can properly decide after a careful analysis of all the conditions and circumstances. When there is plenty of head available, especially if the depth of the valley is comparatively great, a siphon is usually the cheaper in the long run, though not necessarily so in the first cost. But when the available head is restricted a siphon frequently involves either a single pipe so large that it is impracticable or else a number of smaller pipes are required, which not only runs

*See "Engineering News," Apr. 27, 1905, for general description of the whole system; Aug. 8, 1912, for notes on the progress of the system; and Aug. 27 and Sept. 3, 1914, for a description of the 7000-ft. dam across and alongside the Bow River to divert water for the eastern section.

of the [illegible] very [illegible], but also involves a prohibitive loss of head, and consequently a flume is usually preferable, provided the valley is not too deep.

Owing to the size and importance of this crossing it was desired to take no chances with fire, and for reasons of durability a reinforced-concrete structure was preferred over steel if it could be had at a reasonable cost, so designs were worked out using this material.

Most flumes are rectangular if built of wood, and semicircular if built of iron or steel, in the latter case being suspended from girders instead of supported by them. In designing this flume, the suspended steel flume was taken as a model, but instead of using a semicircular section, which is convenient but incorrect, the proper section was chosen, that is the same section as the flume would assume if it were made of a flexible material like canvas instead of a rigid material like steel or concrete. Distortion of a semicircular steel flume under load does no particular harm, because the material can stand it, but with a concrete shell excessive distortion would certainly result in cracks, so the shell was given the correct shape in the first place.

The water channel is 21 ft. wide on top and 8.7 ft. deep at the center. The concrete shell is only 5 in. thick. The lower part or substructure which supports the actual water channel is also of concrete and consists of a series of braced towers 24 ft. apart, carrying reinforced-concrete girders, from which in turn the concrete shell is suspended.

The problem was complicated by the existence of the main line of the Canadian Pacific Ry., which crosses the aqueduct [illegible] near the eastern end. The track is too high to admit of taking the flume over this railway, so it had to go beneath, and is accordingly taken under the railway by a concrete pipe 8 ft. in diameter.

The total fall in the two miles of flume is a little more than 4 ft., which gives a velocity of nearly 8 ft. per sec., or about 6 mi. per hr.

A Condition Gage for Centrifugal Pumps

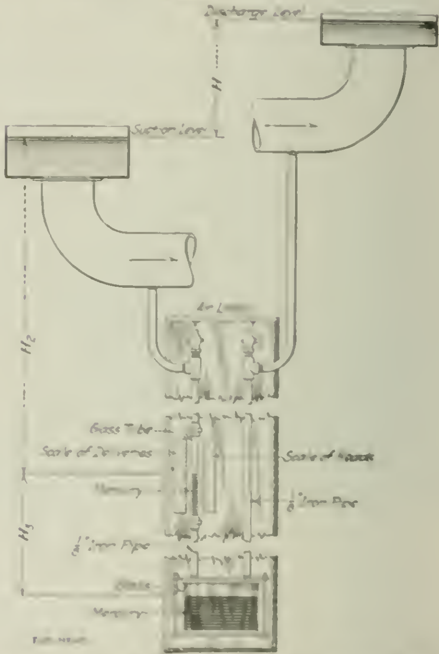
By George M. Peek*

Some means was found desirable of quickly testing the condition of centrifugal pumps in the Chain of Rocks station of the St. Louis water-works. Since the water carries considerable abrasive material, there is apt to be excessive wear, particularly in the labyrinth rings, with reduced delivery and efficiency. The condition of reciprocating units can easily be determined, knowing only speed or strokes (giving total plunger displacement) and metered discharge. (Each pump here discharges through Venturi meters.) But with centrifugals at constant speed, the delivery varies considerably with the head.

At this station, the net head varies between 16 and [illegible] ft., with the river stage and with the amount of water pumped (due to varying friction loss in intakes). The [illegible] centrifugal pumps here have each a capacity of 10,000,000 gal. per 24 hr. against 56 ft. The pumps were tested when in first-class condition and delivery-head curves were plotted. A gage has been set up to show net head and expected delivery, so that a comparison with the Venturi reading gives at once the departure from best condition.

The accompanying drawing shows the arrangement of the gage. The mercury well was made by clamping two steel disks on a [illegible] lubricator glass. The glass tube has a bore of about [illegible] in. Since the area of a [illegible] tube is a very small quantity when compared with that of a [illegible] lubricator glass, the error due to change of mercury level in the well for the total range is negligible; therefore the scale of heads was permanently mounted on the board. The scale of deliveries (determined from the test curve) was installed opposite. The graduations on the scale of heads were based on 1.13 in. of scale per foot of water head (ratio of inches of mercury to feet of water), corrected to 1.047 for the excess depth of water in the discharge-pressure leg (H_3 in the drawing).

In case there were a suction lift on the pump, instead of a suction head as we happen to have in St. Louis, it would be necessary to connect the air cock on the suction side to the air pump or some other means of exhausting any air which may accumulate in the tube above the mercury column.



A Net-Head Gage for Indicating Condition of a Centrifugal Pump

Trouble was experienced with the Venturi meters in this station by the dirty water leaving deposits in the [illegible] mercury chambers. This trouble was eliminated by making a connection with the clear-water pressure mains to the pipes connecting the upper parts of the mercury chambers with the throat and large part of the Venturi tube. In order to prevent deposits of dirt in the mercury chambers, valves are opened when the pumps are started and at such other times as may be necessary, thereby washing all dirt from the connecting pipes.

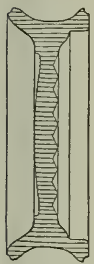
Partitions of Translucent Pressed-Glass Units

Glass units for building partitions of translucent, yet unclouded glass—units held in place by practically invisible joints of reinforced cement-mortar—were recently introduced into the United States. Keppler pressed-glass partitions have been known in Europe for several years. Fig. 1 shows a completed partition built of the sort of units shown in detail herewith.



The glass is very strong, being double-annealed. It is made in 6x6-in. and 8x8-in. sizes and weighs, erected, 10 to 15 lb. per sq.ft. The glass is either clear or amber, although it can be supplied in any color.

In a fire test by the Royal Testing Station, Berlin, a window of this glass was subjected to a temperature of over 1800° F., reached in 30 min., and maintained thus for a half-hour, when water at ordinary hydrant temperature and pressure was played upon the heated glass. Fig. 2 shows the window before and after the test.

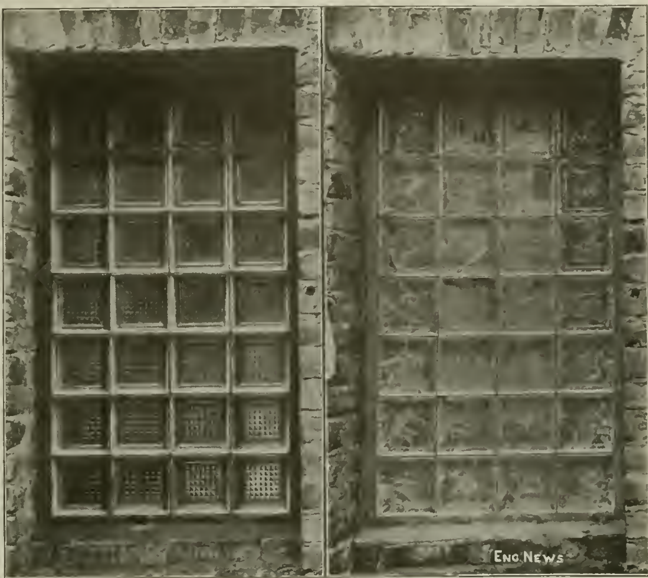


FIG. 2. A KEPPLER-GLASS WINDOW BEFORE AND AFTER FIRE TEST TO 1800° F.

The glass is formed in such a way that while admitting the maximum light, objects a few feet distant from the other side are indistinguishable. This type of construction is also practically soundproof.

The units are furnished with the concave ends painted white and a layer of asphalt over the paint. Light striking the cement frame is reflected into the room by the white surface. The asphalt permits expansion of the units.

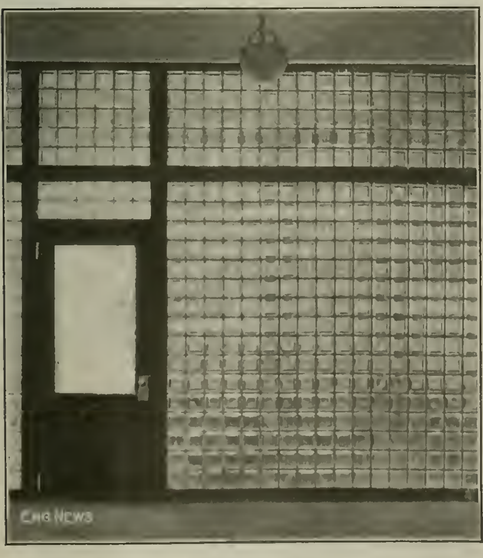

FIG. 1. A PARTITION BUILT OF KEPPLER-GLASS UNITS

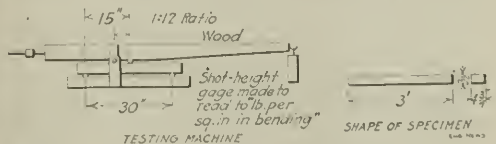
The units are laid up in the same general manner as is terra-cotta tile, and any bricklayer is capable of performing the work. Reinforcing rods are placed both in the horizontal and the vertical joints. The total cost of completed partition varies from $1.20 to $1.50 per sq.ft.

The glass for these partitions, and for other constructions as well, is furnished by Keppler Glass Constructions, Inc., 101 Park Ave., New York City.

A Concrete Field Testing Machine

A very simple testing machine is now in use on the new Welland Ship Canal in the investigation of the strength of field concrete. It is not claimed that the machine is very precise, but it does give a simple method of judging comparative strength of the various concretes being used over the length of the work.

Concrete samples are taken at the mixer and rammed into portable molds giving pieces 36x1¾x3½ in., unreinforced. These pieces are brought into the main office and stored for varying periods and are then broken in the simple leverage machine illustrated in the accompany-



CONCRETE FIELD TESTING MACHINE

(Testing machine for field samples of concrete, Welland Ship Canal.)

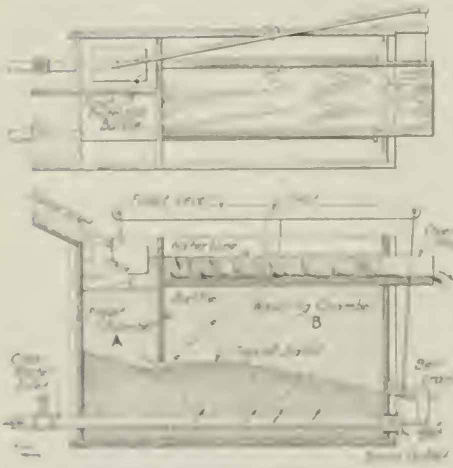
[illegible] The weight at the end of the lever is produced by pouring uniform-size shot into a bucket and the breaking stress in bending (lb. per sq. in.) is read directly on a gage which measures the depth of shot in the bucket and which is scaled to read directly in pounds per square inch. The frame is all of wood, except the steel pins and fulcrum. The leverage is 1 to 12. Comparative records are kept of the breaking stress of different pieces, the [illegible] age of specimen, mix, history of ingredients and location of work from which specimen is taken.

NOTES

An Improved Automatic Sand-Washing Box—The accompanying sketch shows the essential parts of a sand-washing-box discharge [illegible] arrangement designed to overcome some of the [illegible] of discharging described in the excellent article by W. H. Wilson on the operation of sand and gravel plants in the Nov. 19 issue of "Engineering News." This design, in addition to being automatic, avoids the [illegible] of muddy water with the sand, at the cost, however, of [illegible] clear water [illegible] with sand at the bottom of the box, as well as with the sand in the usual way.

The washing box itself consists of a rectangular box with an overflow trough extending about three-fourths its length, [illegible] with the top a few inches below the top of the box. Water overflows the entire length on both sides of the trough and [illegible] at the end of the trough. At the inner end of the trough a baffle is made from side to side of the box, extending from the top about halfway to the bottom.

The [illegible] sand and muddy water enter the [illegible] space between this baffle and the end of the box, in which is [illegible] a [illegible] shown in the illustration, protected somewhat by the baffle, to prevent the [illegible] agitation of the surface water. At the bottom of the trough are two or three water pipes [illegible] on the lower side by [illegible] or [illegible] holes to admit



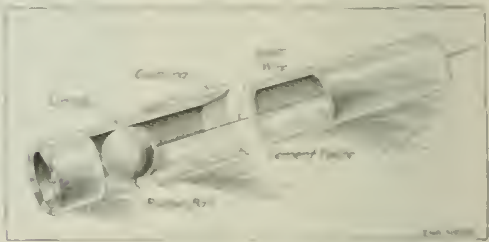
An Improved Automatic Sand-Washing Box

[illegible]

of sand and water in a fluid state. This mixture, being much heavier than the muddy water alone, maintains more or less of a level surface, preventing the muddy water from reaching the outlet until the sand is nearly all out, or the valve is closed, which is adjusted to close after lowering the sand in the box 2 or 3 in.

In operating this box we found it to be well adapted to removing fine grades of sand from the washed product. Of course it took every grade from the coarsest to dust, and when operated slowly made a very clean sweep of it, much better, I think, than mechanical screening would ordinarily do without excessive cost; but as this was of no particular value to us, it was not investigated further. The sand used in this washing box averaged much finer than the analysis of torpedo sand given in the article mentioned before, but had about the same maximum sizes.—T. L. Morton, Cincinnati, Ohio.

A Cement-Lined Joint for a Cement-Lined Pipe was described by J. D. MacBride, manager of the MacBee Cement-Lined Pipe Co., of Boston, Mass., at the November meeting of the New England Water Works Association. The one fault found with cement-lined pipe, in the meeting's discussion on service pipes, was the difficulty in getting a protected joint, for, although the coupling may be cement lined, there is no assurance that there is not an opening at the end of the thread where water will come in contact with the iron and cause corrosion. On a recent piece of work Mr. MacBride was asked to guarantee a fully protected joint and the accompanying sketch shows how he made the joint.



Method of Making a Continuous Cement-Lined Joint in Cement-Lined Pipe

A [illegible] as the pipe was inserted in the length of pipe to be added to. To the ball was attached a stiff wire, which was passed through the length of pipe to be added. The inside of the coupling, threads and all, was then coated with cement paste and the pipe length screwed on, after which the ball was drawn ahead to the next coupling. This insured a continuous cement-lined surface on the interior of the joint and obviated the difficulties met with in the ordinary joint.

Motor Trains for Railway Construction Gangs [illegible] on the Chicago Great Western Ry. as a means of carrying the men rapidly between their work and the camp. [illegible]

A Eulogy on a Hard Working Government Engineering Bureau is given in the following words by Secretary of Commerce Redfield in his recent annual report:

Editorials

Long-Term Highway Bonds

The reckless financial policy of building perishable roads and pavements with borrowed money obtained by issuing long-term bonds, not to be paid off until after the destruction of the work for which the money was borrowed, has often been condemned by engineers. Many counties, cities and states, nevertheless, are still continuing the practice of creating a debt which a future generation will have to pay although little will be left at that time of the improvement which the debt paid for. Engineers, of course, recognize on the other hand that a certain portion of the expense in constructing a road is laid out on work of a permanent character, to pay for which the issue of long-term bonds may be justifiable.

The Department of Agriculture has just issued a bulletin entitled, "Highway Bonds," in which an estimate is made of the percentage of cost in construction of different types of improved roads which is expended on its foundation, such as drainage, grading, etc., and the percentage which is expended on the surfacing which must eventually be renewed. These figures are said to be based on a study of 244 different types of roads. A summary of the figures in this bulletin shows that on a typical gravel road 20 ft. in width, costing $4400 a mile, the expenditure on the foundation features, such as drainage and grading, will be 41% and on the surfacing 59%. On a water-bound macadam road 15 ft. wide, the foundation features cost 37% and the surfacing 63%. On a bituminous macadam road 15 ft. wide, the foundation features cost 27% and the surfacing 73%.

Of course, the above figures represent merely broad averages and the bulletin points out that part of the cost of the surfacing, the foundation course for example of a telford road, may also be regarded as a permanent investment. Bearing this in mind, it is estimated that on a water-bound macadam road, 62% of the cost might be regarded as a permanent investment, and on a bituminous macadam road about 56%.

It is to be hoped that a wide circulation of this bulletin may have some influence toward checking the indiscriminate issue of long-term bonds for road building purposes. In a number of states in the West especially there has been a carnival of extravagance in the issue of county bonds for highway work, and much of the money thus raised has been expended in a manner which will leave little benefit in the way of improved roads to be found after a very few years.

Eliminating Politics from New York Highway Work

"A study of the legislation relating to the New York State Highway Department clearly shows that this department has been looked upon in the past as a great political machine." This statement is made by John M. Carlisle, State Commissioner of Highways of New York, in a recent letter to the New York *Times*, in which he points out that during the past ten years there have been seven different heads of the New York Highway Department, and says "it is remarkable that as good results as have been secured have been attained under such a system."

In order to do away with this constant tinkering with the Highway Department by legislatures of changing political complexion, Mr. Carlisle urges that the coming Constitutional Convention in New York should make the headship of the Highway Department a constitutional office, with a term of at least five years in case of a single commissioner, or of six years in case a commission of three members is established, with one member going out of office every two years.

Mr. Carlisle's recommendations ought to carry great weight. Engineers, at least, realize that the first essential to economical and efficient work in highway construction and maintenance is the creation of a permanent working organization, to be conducted without regard to politics. It is well nigh impossible to create such an organization if its responsible head is subject to change for political reasons at every election.

A Suggestion for Water-Works Valuation

An interesting discussion of this question was recently given by J. W. Ledoux, Chief Engineer of the American Pipe & Construction Co., in a paper entitled "Some Observations on Water-Works Valuation" read at the Atlantic City meeting of the Pennsylvania Water Works Association.

Mr. Ledoux is an engineer of long experience in water-works construction and operation. He estimates that the average appraisal for the total value of a going water-works plant should be in the neighborhood of 183% of its physical cost. Mr. Ledoux distributes this allowance as follows, and states that the percentages are the result of his judgment based on a considerable amount of practical experience:

Physical cost, 100.
Promotion, 2½.
Organization expenses, 2½.
Engineering, 3.
Financing, 18.
Legal expenses, 2.
Rental or cost of construction plant and housing of employees, 2.
Contingencies, 10.
Interest during construction, 5.
General contractor's profit, 15.
Development cost, 20.
Allowance for useless items, 3.
Total, 183% of the physical cost

It will be noted that the two largest items in the above table are financing and development expenses. Regarding the first, Mr. Ledoux says that in selling bonds to obtain money for construction, the usual method in financing private water-works, 90 is about as good a price as the water companies can expect to obtain from the bond houses. As the final cost of the plant must include all

[illegible] as well as the physical cost, it may be assumed that the total amount to be provided will be 165% of the physical cost and dividing 165 by 90 the total expense of financing will be 18% of the physical cost of the plant.

Regarding the 20% allowance for development cost, Mr. [illegible] says this will be more often exceeded than not. A public utility must, like any other business enterprise, gradually acquire its customers, and must expend a certain amount of energy and expense in order to secure them, oftentimes finding it necessary to operate at a loss or at reduced profit for a time in order to do this.

The allowance of 5% for engineering expense will be generally agreed to be extraordinarily low. Even for plants of considerable size, 6 or 7% would be not an extravagant allowance.

It is worth noting that most of the items included in Mr. [illegible]'s statement above apply to a municipally constructed plant as well as to one built by a franchise company. The only items that would not be at least as large in a city-built plant would be those for promotion, organization expenses, and financing. The promotion of a city-owned plant may be done as a matter of public spirit; but there will generally be some outlay for financing, as many cities have to allow some commission to brokers in order to dispose of their bonds.

Wanted: Engineering Promoters

There is one profession, if we may call it a profession—although most people would doubtless call it a business—and many of them a bad business—the ranks of which are seldom overcrowded. We refer to the profession, art or calling of promotion.

It is named promotion for want of a better name, and, unfortunately, the name carries with it very nearly an indictment of doubtful moral character. Yet it is strictly true that in practically every business enterprise of magnitude, and particularly in enterprises connected with engineering, [illegible] on the [illegible] which is generally termed promotion, and on the way in which this work is done the success or failure of the enterprise will very often turn.

It is often said that an engineer is of no use as a promoter, [illegible]. This, however, is a cynical view and does not bear careful examination. Experience shows that the dishonest promoter, like the dishonest banker, while he may sometimes [illegible] of [illegible] prosperity, very soon finds his occupation gone. Conditions in business and engineering have changed so vastly in the past [illegible] years that the old-time promoter, made famous by Mark Twain in his biography of Colonel Sellers, has become nearly extinct. The more [illegible] and less [illegible] type of promoter than Colonel Sellers—well illustrated by the [illegible] of [illegible] opportunities in [illegible] [illegible]—has been pretty thoroughly put out of business by the [illegible] of the Federal courts. [illegible] the disappearance of the class of men who made the name of promoter [illegible], it is worth while to call attention to the fact that the business of promotion in the engineer [illegible] a field which offers [illegible] opportunities.

[illegible] of these opportunities, for example, is advertised in the "Situations Open" columns of our current issue.

A very large engineering enterprise of undoubted public benefit is to be carried forward. It is a public enterprise and not that of a private corporation; consequently, the public which is to eventually foot the bills must be shown that the project is a sound, safe and beneficial one. The men who are in charge of this large work are far-sighted enough to see that this task of public education is not a thing which can be done by spasmodic efforts, nor is it one that the ordinary engineer of high technical qualifications is at all fitted to perform. The man to fill this place, for one thing, must be a good speechmaker, able to talk before an audience at a public meeting, to meet and disarm criticism, and to convince those in attendance that he has sound sense on his side.

He must know how to practice the art of publicity, how to reach and interest the newspapers, not spasmodically but continuously. He should be a man whose personality is such as to command the confidence of the men whom he meets in all walks of life. Finally, he must be a man knowing at least enough about the technical engineering features of the project to be able to explain it clearly and convincingly to anyone and everyone, and to meet technical criticism from any source.

It will be evident that this specification is not easily filled. We allude to it here, not because of this one opening, but because it is typical of the class of openings that are available in many places for men with such qualifications as are described. It illustrates a class of opportunities open to young men in the engineering schools, provided they have the proper amount of natural talent on which to build, and this amount need not be as great as is sometimes thought. The reason why most lawyers are far better public speakers than engineers is undoubtedly because the lawyer, engaged in court practice at least, is continually cultivating the art of addressing an audience, while most engineers seldom have occasion to cultivate whatever talent they may possess in this field.

We are told that notwithstanding the fact that old graduates are repeatedly urging upon the boys in the technical schools that they should cultivate the art of writing good English and of excellence in debate, few of the engineering students take any interest in these branches of the curriculum. If they realized how largely ability in this direction would aid in their progress toward success in active life, in comparison with their expertness in the technical work of their profession, there would doubtless be more earnest work in the English classes in our engineering schools.

Some Further Lessons from the Edison Conflagration

In connection with the conflagration in the manufacturing plant of Thomas A. Edison at West Orange, N. J., so fully illustrated in our last week's issue, some further comment is justifiable, in view of the unusual character of the fire and the wide interest in its results.

A superficial observer who visits the scene of the conflagration, or who scans the photographs of the gutted buildings in our last week's issue, may perhaps get the idea that a reinforced-concrete structure is deficient in resistance to fire. Such an observer, however, who visited the scenes of the conflagrations in Baltimore or in San Francisco, or examined the pictures of the fireproof buildings in the burned area that were fully shown in Engi-

NEERING NEWS at the time, would likewise become firmly convinced that the steel-frame structure protected by fireproofing was deficient in its resistance to fire.

Our readers who do not recall definitely the occurrences in those fires can easily refresh their memories by turning back to our issues published at that time, and will find it interesting to compare the behavior of a number of the steel-frame structures there exposed with the condition of the buildings in the Edison plant.

It should be distinctly borne in mind that the destruction of the Edison plant is to be classed as a conflagration and not as an ordinary fire. The number of buildings involved, the juxtaposition to each other, the almost total absence of effective fire fighting make the conditions in the Edison plant strictly comparable to what occurs in a city conflagration. Further than this, it is altogether probable that the inflammable material contained in the Edison buildings burned more quickly and possibly produced a greater degree of heat at some points (though this latter is uncertain), than occurred in the Baltimore or San Francisco conflagration, where nearly all the steel-frame fireproof structures affected were office buildings containing only the usual amount of office furniture.

Some comment seems worth while also regarding the relative damage done to surface finish in the reinforced-concrete structures and the steel-frame structures protected by fireproofing. The office buildings in the Baltimore fire which passed through the conflagration with little structural injury, required renewal of practically all of their plaster finish on walls and ceilings, which was, of course, to be expected. A noticeable feature in the reinforced-concrete buildings at the Edison plant is the very small amount of injury done to the ceilings. In the manufacturing plant there was, of course, nothing in the way of surface decorations to be destroyed, but the behavior of this monolithic concrete surface under the severe exposure to fire is a notable testimonial to the excellence of good concrete construction.

From the description and illustrations in our last week's issue, it is evident enough that another of the lessons of the fire, to the engineer engaged in the planning of industrial plants, is the desirability of generous space between buildings, and further the provision of some resistance to the spread of flames in the shape of wire-glass windows, and fire-resisting division walls to divide up the large floor areas. It is quite true that most large manufacturing plants, especially those which have grown by successive increments, are much more crowded than considerations of safety would dictate, or even requirements of good lighting.

The plea is often made that the economy in inter-works transportation resulting from placing buildings close together offsets the increased fire risk; but with a plant equipped with modern methods of transportation, when material is once loaded upon a car or motor truck, it makes comparatively little difference if the length of haul from building to building is 100 to 200 or even 300 ft. greater.

Referring again to the general behavior of the reinforced-concrete structures at West Orange, it is to be remembered that these buildings were most of them four or five years old, and it is needless to say a great deal of progress has been made in the art of reinforced-concrete design during that period. It is altogether probable that expert analysis will show that in some respects the design of the buildings was not all that would be found in the work of first-class engineers at the present day, aside from the particular question of the column design, which was discussed in our last week's issue. That under these conditions the buildings made such an excellent showing is to be accepted as a testimonial to the fire-resisting quality of reinforced concrete.

Letters to the Editor

Mechanical Resuscitation Devices

Sir—In your issue of Dec. 3, p. 1109, you have a note entitled "An Efficient Method of Resuscitation." This note refers to the method developed by the U. S. Bureau of Mines. I have not had the pleasure of reading the report from which your article is abstracted, but I believe that some harm might be done to at least one perfectly safe and very useful resuscitating device if engineers should implicitly believe that part of the note which says "no mechanical artificial resuscitating device should be used unless one operated by hand that has no suction effect on the lungs."

This letter is prompted by experience with a device for resuscitating persons overcome by illuminating gas, which is entirely automatic and is only operated by hand in case the operator so desires. There is also no suction of sufficient force to cause the least danger to the lungs.

R. C. KELLOGG,
Civil Engineer, Brooklyn Union Gas Co.
Brooklyn, N. Y., Dec. 7, 1914.

More 1000-Ft. Dry Docks

Sir—I beg to call your attention to the omission of the Balboa Dry Dock, Pacific Terminals, from your list of dry docks over 1000 ft. in length, given in ENGINEERING NEWS, Nov. 26, 1914, p. 1064.

The Balboa dock is under construction and will be finished during the year 1915. The principal dimensions are:

	Ft.
Length over all	1110.0
Maximum length of ship dockable	1000.0
Width of entrance, clear	110.0
Width of body of dock at coping	140.0
Width of body of dock at floor	117.0
Depth, coping to floor	56.0
Height of keel blocks	4.6
Depth of water over tops of blocks	
Mean sea level	35.0
Mean high water	41.5
Mean low water	29.3

RAY W. BERDEAU,
Resident Engineer's Office.
Paraiso, C. Z., Dec. 3, 1914.

[Since the article in question was written it has also been announced that the Pearl Harbor dock at Hawaii, for the United States Government, will be rebuilt for a

length of [illegible]. It will be remembered that the found[illegible] of [illegible] (then [illegible] in length) failed during construction some years ago.

The [illegible] dry docks and the proposed docks of about equal length at Halifax, N. S., and North Vancouver, B. C. (noted in the Construction News sections of ENGINEERING NEWS, Dec. 3 and Sept. 24, 1914) show clearly that the "[illegible] dry dock" is no longer a novelty. —EDITOR.]

The Chicago Flat-Slab Ordinance

Sir—Being particularly interested in concrete flat-slab design, the writer read with interest the Chicago Building Code on this type of construction, as given in your issue of Sept. 24, 1914, p. 602, and its subsequent criticism by Mr. Godfrey, Nov. 12, 1914, p. 993.

There is one point of inconsistency that the writer would like to call to your attention, that is, the case of rectangular panels. Where the difference between the length and breadth is less than 5%, the panel is designed as a square panel of average length; but for over 5%, a different procedure is resorted to.

The article in the code pertaining to the latter case permits of two different interpretations, the ambiguity possibly arising from an attempt on the part of the writers of the code to combine the regulations for two-way and four-way reinforcement in the same article. An illustration of the procedure for each interpretation and its results are given below. First:

Let [illegible] length 10% greater than the breadth; then for L = length and B = breadth, $L = 1.10\,B$ and the average panel is $1.05\,B$. The moment at the center of strip B (diagonal band) is

$$M = \frac{w\,L^2}{40} = \frac{w\,1.05\,B}{40}$$

The steel in the strip along length L is then taken as $\left(\frac{1.10}{1.05}\right)^2$ times that obtained by the above formula, which is equivalent to designing for a moment,

$$M = \frac{1.1^2 w\,1.05\,B}{40} = \frac{w\,1.[illegible]\,B}{40}$$

On the other hand, if we were to take the formula for differences of 5% or less we would obtain the moment at center of strip A (diagonal band):

$$M = \frac{w\,1.05\,B}{40}$$

This difference is altogether too great in panels of a [illegible] [illegible]. [illegible] and [illegible] by the same design.

The second and more likely interpretation assumes that the strip A is to be designed for bending moment $\frac{w\,L^2}{40}$ (where L is to be the average panel length), the steel required [illegible] and multiplied by one-half the average panel length to obtain the amount of steel required for the panel. The amount of steel required [illegible] of the rectangular panel is then found in [illegible] to the amount required by dividing the [illegible] of the actual panel length by the [illegible] of the average panel length.

This method will resolve itself into the following: Moment for center of strip A for average panel is,

$$M = w\frac{\overline{av.\,L}^2}{40}$$

where $av.\,L$ = average panel length. The steel required would be given by formula,

$$M = w\frac{\overline{av.\,L}^2}{40} \times \frac{av.\,L}{2}$$

For longer span L, steel required would be obtained from formula:

$$M = \frac{w\,\overline{av.\,L}^2}{40} \times \frac{av.\,L}{2} \times \frac{L_1^2}{\overline{av.\,L}^2} = \frac{w\,L_1^3}{2 \times 40}$$

which is the same as the moment for square panel of length L_1 and therefore independent of the other dimension. Similarly, for shorter span B steel would be given by formula

$$M = \frac{w\,\overline{av.\,L}^2}{40} \times \frac{av.\,L}{2} \times \frac{B^2}{\overline{av.\,L}^2} = \frac{w\,B^3}{2 \times 40}$$

which is the same as the moment for square panel of length B.

If this is the intent of the code, it certainly could be much more clearly and simply stated, but it would give results almost as inconsistent as the other interpretation, particularly apparent in the case of the negative moments over the [illegible], where the moments would be $\frac{w\,L_1^3}{2 \times 15}$ and $\frac{w\,B_1^3}{2 \times 15}$ respectively, on adjacent edges of the caps, and for the limiting value of $L_1 = 4/3\,B$ would require 2.4 times as much steel on one edge as that required on the adjacent edge.

As for Mr. Godfrey's criticism, it seems that although [illegible] of the omission of a provision for taking consideration of the bending in the columns is just, his attitude toward the slab design is not justifiable. Nobody can at the present time state what the exact theoretical [illegible] this type of construction are, but the [illegible] [illegible] at times stated in the code could be [illegible] [illegible] two-way reinforcement with no much apparent [illegible]. A consideration of the bending moments must include a consideration of the lines of inflection and these are entirely different in the various types of slabs and would account for the difference in the moments.

M. [illegible].

[illegible] W. [illegible] St., New York City, Nov. 21, 1914.

Sir—The criticism "Flat Slab [illegible]," by Edward Godfrey, in your issue of Nov. 12, regarding the new provisions of the Chicago building ordinance for the design of flat-slab construction, should hardly be allowed to pass without discussion.

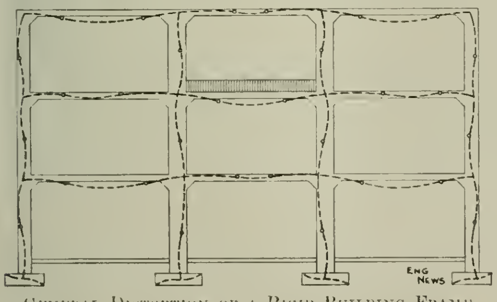
I have devoted twelve years to theoretical study and practical experience in the design and erection of all types of reinforced-concrete construction in Germany, France and the United States. Fortunately, I am not connected with any concern commercially interested in reinforced-concrete construction and, therefore, my conclusions may be considered as unprejudiced and based entirely on experience and science.

Mr. Godfrey's ideas may be divided into two groups: the first in criticism of the attitude of the Chicago build-

ing ordinance toward concrete construction in general; the second in criticism of the late additions to the ordinance respecting flat-slab construction. In order to maintain a scientific point of view, it is necessary to separate these two ideas strictly. I agree with Mr. Godfrey in the first instance; it seems surprising that the ordinance of a large progressive city like Chicago should not make more concessions to a scientific treatment of continuous-slab, beam, and girder construction, inasmuch as the best ordinances of most of the progressive countries do so. But with the second group of Mr. Godfrey's ideas, I must disagree. In my judgment the new additions to the Chicago building ordinance relating to flat slabs reasonably accord with scientific principles and the practical conditions governing the actual interior stresses.

Mr. Godfrey's first objection is to the paragraph regarding negative moments. If the designer reinforces the edge of the column cap where the effective depth is a minimum, he surely will be safe, because the increased effective depth of the column cap will always offset the increase in negative moment, and the experienced designer always will run the reinforcement across the column head in order to secure the necessary bond and to splice the rods at the points of inflection where the bending moment is a minimum.

The effect of negative moments on the columns is quite frequently overestimated by engineers. It requires, of course, a study of statically indeterminate stresses in



General Distortion of a Rigid Building Frame under Localized Load

order to value this influence reasonably. The sketch herewith shows that, under usual conditions where flat-slab construction is used, the negative moment is not taken care of by one or two columns, but by the entire structure. The four supporting columns are not only rigidly connected with the columns above and underneath, but are also connected by means of the adjoining slabs with the next two or three surrounding vertical rows of columns, thus forming a framed structure out of the entire building. The apparently large influence of the negative moments on the columns will become very small, being divided among so many different members of the structure. It is easily proved by analysis that the combined stresses due to bending and direct load will never, under normal conditions, exceed the stresses due to the maximum direct load.

As to Mr. Godfrey's criticism regarding the positive moments in the slab, the following may be stated. The assumption of support on two sides only is opposed to the fundamental principle of the square-panel slab, which is to support the slab on four sides. It is evident that the fractions given in the ordinance, to be used in determining the moments, are only a means to simplify the method of designing and checking. To satisfy himself every conscientious engineer will check up the suggested fraction. A thorough investigation will prove that a scientific determination of the moments, following the theory of elastic deformation of the material, in continuous and framed structures gives practically the same results as a design according to the regulations of the Chicago Building Ordinance. Everyone will agree that the final result is the important part of the design and not the method of arriving at this result.

Mr. Godfrey's supposition as to the method of deriving the empirical formulas for computing the interior stresses in flat slabs in this code are at least questionable and require no discussion.

Curt Von Mueller,
Civil Engineer.

Chicago, Ill., Nov. 24, 1914.

Sir—In the article on the new regulations formulated by the Commissioner of Buildings of Chicago, for governing reinforced-concrete flat-slab floor design, it was stated that this ruling is the result of some four years' study and testing. According to information which I have, this new regulation does not differ materially from the tentative one which has been in force by the Chicago Department during these four years of study. This tentative ruling in substance was the so called McMillen formula, to which was added a definite requirement for the cantilever portion of the slab. The new ruling differs from the method used by McMillen (Engineering News, Mar. 31, 1910) in that the moment in the diagonal center of the panel for four-way system is 20% less, and that in the direct belts 20% more. It is to be supposed, therefore, that this change is the result of four years' study and testing by the Chicago Department.

It is not apparent to me, in just what way this new regulation is the result of test experience so far as same has been published. Tabulated below are values which are given for the steel stresses as measured by strain gages and as computed by this new Chicago regulation for five buildings, reports of the tests of which have been published.

SCHEDULE OF STEEL STRESSES

Names of Buildings	Test Load, Lb. per Sq.Ft.	Mid-Span Computed (Lb. per Sq.In.)	Mid-Span Measured (Lb. per Sq.In.)	Edge of Capital Computed (Lb. per Sq.In.)	Edge of Capital Measured (Lb. per Sq.In.)
		25,800†	8,200		
Northwestern Glass Co.	400	14,400	4,300	28,800	20,000
		26,400	6,900		
Deere & Webber Co.	340	10,000	5,100	27,700	20,700
		12,700	4,540		
A. J. Frank	250	7,500	1,070	8,050	4,575
		25,000	3,300		3,500
Larkin Co.	370	15,100	3,000	18,100	5,400*
		16,200			
Shredded Wheat Co.	191	19,000	19,000	25,500	17,000

*At edge of drop.

†Upper values for direct belt stresses; lower values for diagonal.

The results given are for the loadings in the respective buildings, which were uniform over several panels. The first two buildings are in Minneapolis, the second two in Chicago, and the last one in Niagara Falls, N. Y. Reports of tests of all these can be found in engineering literature.

It should be noted that the two Minneapolis buildings were designed with the old standard flared capitals without the depressed panels; the two Chicago buildings had depressed panels adding to the thickness of the slab in the

region of the columns, the Niagara Falls building also had a depressed panel, but this was so little (2 in.) as to be of much less importance than those in the Chicago buildings. The Minneapolis and Chicago buildings are of the four-way type of reinforcement, while the Niagara Falls building is of the two-way type.

The Chicago rules give stresses from two to three times those measured in the mid-span for the four-way types, while for the two-way type the Chicago rules agree with the higher measured stress. For the cantilever steel stress over the edge of the capital the Chicago rules result in stresses about [illegible]% above those measured, where no depressed panels are used, and about 100% higher than those measured for the two Chicago buildings having substantial depressed panels.

It has been stated in engineering discussions in this connection by some of the Chicago engineers that tension in the concrete reduces the stress in the steel reinforcement, and accordingly computed stresses should be higher than those measured, in order to allow for this tension effect of the concrete. Probably most engineers will agree that the concrete tension does produce lower measured steel stresses for buildings relatively over-designed, like the Larkin Building, where the unit working stresses measured from three to four thousand pounds. These stresses might be about double with the concrete tensile strength not acting. No engineer can put up a very strong argument that the tensile strength of the concrete affects the steel stresses when the latter measure 15,000 to 20,000 lb. per sq.in., and the concrete is broken up by tension cracks of considerable size. Even with low steel stresses of some 8 to 10,000 lb., the concrete loses its tension effect after the load is left on a day or two because under continued stress it gradually stretches out and leaves the steel to assume the entire tension. This property of the reinforced slab is familiar to those with experience in testing, and can be verified by the outsider who may be unfamiliar with testing, if he will but refer to reports of load tests where he will find cases in which the loading has been left on overnight or for a day or two. These cases show the steel stress materially increased after a day's time, with no increase of loading.

The table shows that the rules required in effect a factor of safety of six for the cantilever portion of the slab, and a factor of safety of eight or ten for the mid-span in the four-way systems and a factor of safety of four for the mid-span of two-way systems. It appears to the writer that this new regulation should be revised to give requirements in accordance with the test data, and that until it is revised, one is not justified in claiming that this ruling is based upon test data.

E. S. Martin,
Designing Engineer, C. A. P. Turner.
[illegible], New York City, Dec. 8, 1914.

(In Engineering News, Nov. 19, 1914, p. [illegible], there were [illegible] the new flat-slab portion of the Chicago Building Code. Some of these objections seem to be due to the fact that each requirement had given the code an [illegible] study.

He mentions the "uncertainties" which [illegible] [illegible] and then proceeds to point out [illegible] of considering the column shaft as part of the resisting section and bending moment over the face of the column. The very definition of "strip A" in the code precludes the suggested interpretation, when it says:

Strip A shall include the reinforcement and slab in a width extending from the center line of the columns for a distance each side of this center line equal to one-quarter of the panel length.

No mention of including the column shaft or cap in the above definition is to be noted.

The design of flat slabs is admittedly somewhat empirical and the phrase quoted, "At the edge of the column cap or over it," was doubtless inserted to emphasize the necessity of providing within the slab depth sufficient resisting moment from one edge of the column cap to the other. The necessary increase in total resisting moment from the edge of the column cap to the center is provided by the specification covering the size of cap. This increase is assured by requiring that the cap and slab shall be cast monolithic. It, therefore, seems that the only "uncertainty" pointed out is more or less mythical.

The code is further criticized for ignoring the bending in the column shaft. Section 552 limits a reinforced-concrete column in ordinary construction to one-twelfth of its length. The flat-slab code limits the column size to one-twelfth of the panel length. The same section limits in all cases the minimum steel to $1\frac{1}{2}$% of the concrete area. The least sizes, therefore, for columns with an average story height of 10 ft. and an average panel of 20 ft., are in the proportion of 20 in. to 10 in., when contrasting flat slab with any other type of reinforced-concrete floor. For direct load, the flat-slab minimum column is, therefore, four times as strong as the regular column, and for bending eight times as strong, since the column area varies as the square, and the section modulus as the cube of the side of a square column. Thus, this flat-slab code very definitely recognizes and provides for the moments induced in the column shaft, again emphasizing its superiority. Its originators are to be praised for the good judgment shown by inserting this "one-twelfth of the panel length" provision.

Even though the critic's contentions were true for this flat-slab code, the last sentence of paragraph (a), Section 552, of the original code makes it necessary to design columns for the unbalanced moment. The completeness of the flat-slab code, however, prevents any differences of opinion as to the magnitude of the unbalanced moment where small columns would otherwise carry the load.

Your correspondent's demonstration of minimum moment coefficient is delightfully simple. Unfortunately, however, the observed deflections do not conform to the simple assumptions which he has tacitly made. Uniformly increasing bending from his section "MP" to section "NQ" does not obtain, due to the stiffness existing adjacent to the columns by virtue of the bands of steel parallel to "MP" as well as the diagonal bands. Even on so fundamental a proposition as the total of positive and negative moments for panels, authorities are quite opposed in their views. One estimate, obtained by integration of radial elements, gives a total of about [illegible] WL, where W = total panel load and L = distance c. to c. of columns. The other estimate, by demonstrating to the satisfaction of its adherents that "circumferential moments" equals "radial moments," gives a total of about [illegible] WL. On the same basis, the Chicago Code has [illegible] WL negative at column top in each of the two rectangular directions and [illegible] WL in each of the two diagonal directions, or a total of [illegible] WL negative. Each diagonal band has

$^1/_{120}$ WL and each rectangular band $^1/_{80}$ WL or a total of $^1/_{24}$ positive moment. The sum for both positive and negative equals $\frac{1}{8}$ WL, a commonly accepted total in ordinary construction. These facts seem to indicate that the totals used by the Chicago Code lean decidedly toward the conservative, as is entirely proper in a public regulation. Properly considered, there does not seem to be the element of weakness which the critic fears from his simple demonstration. As for distribution between positive and negative, suffice it to say the coefficients specified by the code accord admirably with the tests upon this type of construction.

Tests, however, upon completed buildings are tabooed. The reason assigned is that "only a portion of the floor is ever loaded." And yet, when discussing moments, emphasis was placed on the fact that the conditions analyzed were those of perfect balance at the columns. One would surmise, therefore, that tests on "portions" would reveal by the extensometer readings, unit stresses far beyond the 25% excess which the critic discovers for ideally balanced conditions. The fact that such excesses do not occur is evidence of the sanity of the code coefficients.

One of the most admirable features of this code is the provision for negative moment in the so called "strips B." Although practically every test shows a tendency for the slab to crack in the top on the rectangular lines between column centers, designers have been altogether too slow about making definite provision for the moments thus indicated. To the writer's knowledge this Chicago Code is the first formal regulation to definitely recognize this weakness in past designs.

It appears, therefore, that its sponsors are to be especially congratulated: (1) Upon the excellent choice of moment coefficients; (2) upon the provision that the minimum column diameter must equal one-twelfth of the panel length; (3) upon the requirement that negative moment must be considered across the top of the rectangular bands.

O. W. Irwin,
Chief Draftsman, Trussed Concrete Steel Co.
Youngstown, Ohio, Nov. 23, 1914.

NOTES AND QUERIES

Data on the life of cast-iron pipe used for discharging sewage are desired by a correspondent in Columbus, Ohio.

G. H. H., Clinton, Mass., writes: "Can you refer me to any souce of information as to the effect of dyehouse acids and steam upon concrete?"

In the article describing the floating caissons for the Panama Canal, by L. A. Mason, in our issue of Dec. 3, due credit should have been given to Henry Goldmark, who was responsible for these structures as Designing Engineer for Lockgates and Protective Devices on the Canal, and to Col. Hodges, Assistant Chief Engineer, who had the primary responsibility for all features of design in connection with the machinery of the locks. During preliminary studies on the lock gates of the canal and their operation, Mr. Goldmark became impressed with the necessity for floating caissons, and advocated their use. After the construction of these caissons was authorized, he was entrusted with the preparation of the plans and specifications for them, and this work was prosecuted under his direction from 1910 until 1913, the final plans being submitted to Col. Hodges, Assistant Chief Engineer. The principal drawings and computations for the caissons were made by Mr. Mason, the author of the article in question, who was an assistant to Mr. Goldmark in the Lockgate Subdivision, a work for which Mr. Mason's long experience in shipbuilding made him particularly valuable. All parts of the design, however, remained under Mr. Goldmark's immediate supervision.

The American Good Roads Congress

The fifth good roads congress of the American Road Builders' Association was held at Chicago last week.

The President, W. A. McLean, Commissioner of Highways for Ontario, in his address pointed out that the use of the term "permanent" as applied to surfacing materials for roads gives the public a wrong impression. Any road surface is subject to wear and disintegration and adequate provision should be made for repair and renewal.

A paper on "Concrete Roads," by J. H. Kuelling, County Highway Commissioner, Milwaukee, Wis., described the extensive construction of such roads in Milwaukee County. The question of expansion joints is unsettled; the spacing has been increased from 25 to 35 ft. and then to 50 ft. without unsatisfactory results. He doubted the necessity of using steel plates in the joints, as these cause the concrete to chip, thus demanding an almost immediate tarring of the joints. A joint with felt filling and slightly rounded edges would meet the requirements. In placing the concrete he preferred a gravity spout to a dump bucket on a boom.

In the discussion, P. C. McArdle, Acting State Highway Engineer of Illinois, advocated thorough rolling, rather than relying upon the concrete to bridge over soft spots. He did not approve of spouting the concrete as it is apt to be made much too wet, which results in ultimate cracking of the concrete. He agreed that armored expansion joints are not desirable, and stated that in Illinois the joint spacing had been increased from 50 to 75 ft., and now to 100 ft.

In a paper on "Brick Roads and Streets," John Laylin, Division Engineer of the Ohio Highway Department, said that while a concrete base is used as a rule, much brick paving has been laid directly upon a sandy or gravelly soil and has given good service for several years under light or medium traffic.

A paper on "Wood and Granite Block Paving," by William A. Howell, Engineer of Streets and Highways, of Newark, N. J., dealt with the practice in that city. Wood blocks are 4 in. thick, laid on a 1-in. cushion of cement and sand (1:4). An unusual feature is the dipping of the blocks in water before laying them. The practice has been successful.

The blocks were treated with 18 lb. of creosote oil per cubic foot of wood. There was some bleeding of oil upon the street, but sand was sprinkled and the coating scraped off, so that there was little complaint of the oil being tracked into buildings. In the discussion, Geo. W. Tillson (Consulting Engineer to the President of the Borough of Brooklyn) briefly reviewed present practice in wood paving, and spoke of slipperiness as a common defect. This may be provided against by open joints, formed by lug blocks or by strips of lath between the blocks, this latter practice being used in Kansas City.

Features of the granite-block paving at Newark are the use of close joints (which gives a smoother and less noisy surface) and the use of old blocks cut in half and dressed to shape. The city proposes to do this cutting and dressing and then sell the blocks to the contractor. Mr. Tillson favored the close-joint stone paving, and thought that the reduction of noise due to rubber-tired motor vehicles would result in bringing granite-block paving into more general use, in view of its high wearing qualities. Mr.

D[illegible], Chief Engineer of Highways, Borough of Manhattan, New York City, also favored the close-joint paving, and also the use of a bituminous rather than cement filler, as making a less noisy pavement and making easier the inevitable tearing up and relaying of the pavement.

"Bridge Floors and Paving" was dealt with in a paper by Clifford Older (Bridge Engineer of the Illinois Highway Department). This related to steel bridges on country roads and showed the advisability of continuing the regular road-surface material across the bridge. For old bridges, a good floor consists of 3-in. creosoted plank covered with a bituminous gravel composition.

The subject of "Convict Labor in Road Construction" was presented in a paper by T. J. Ehrhart, State Highway Commissioner of Colorado. The system has been in use in that state for 14 years. No armed guards are employed, each man giving his word not to run away, and in six years less than 1% of these men have attempted to escape. About 300 men are now employed in this way.

The exhibition of road machinery, appliances and materials was notably complete and comprehensive.

A Batch Timing and Measuring Device on a Concrete Mixer

The concrete mixer for road work exhibited by the Koehring Machine Co., at the show accompanying the annual convention of the American Road Builders' Association at Chicago last week, has as auxiliary equipment a new attachment for recording the number of batches and for determining the duration of a mix of each batch.

This attachment, called the "Batchometer," consists of a small recording meter and an automatic signal bell, housed with necessary dry batteries in a metal case with [illegible] 14 in. square by 4 in. thick. This case is shown in the accompanying view.

When the side loader is raised the short arm shown is also raised, operating the meter and at the same time raising the [illegible] in the cylinder, which is filled with glycerine. After a definite time, which can be adjusted as required by a little contact point fastened by a setscrew to the vertical rod and has a range of from 3 sec. to 3 min., the bell is rung as a signal to the operator to dump the batch. The same signal can be used to control the operation of the side loader so that loading and dumping can be made practically simultaneous. Such an equipment eliminates guesswork from the time of batch mixing and should assure the uniform mixing of all the batches. At the end of the day there is also readily available a complete record of the total number of batches run.

OPERATING PARTS OF THE "BATCHOMETER"

Notes from Engineering Schools

UNIVERSITY OF ILLINOIS—The cornerstone of the new Laboratory of Chemistry has recently been laid. This will be a five-story structure occupying a ground area a little over 200 ft. square. It is aimed to make this one of the most complete institutions of the kind in the world and one well adapted for the complete training of men in every branch of chemical work. There are now 1500 students in this department and 54 instructors.

NEWS NOTES

An Ore Wharf and Warehouses Burned at Skagway, Alaska, on the night of Dec. 12. The damage is estimated at $210,0[illegible]—$60,000 on the wharf and the remainder on the buildings and contents. A fireboat saved the ore bunkers. This wharf handled all shipping at Skagway.

A Heavy Blast Sent Eight Boulders into a House [illegible]0 yd. distant, in Philadelphia, on Dec. 1[illegible]. The blasting was done by a contractor, and it is not known how heavy a charge he used. The City of Philadelphia limits dynamite charges to [illegible] lb. The Bureau of Highways is investigating the cause of the accident. The damaged house was a three-story stone dwelling.

A Universal Water-Meter System for Sheboygan, Wis., is proposed and a popular vote on the subject will be taken in April, 1915.

A Road Congress at San Francisco in 1915 will probably be conducted jointly by the American Highway Association and the American Road Builders' Association. [illegible] is to appoint a committee of two, and the four thus appointed are to choose a fifth member, thus forming an executive committee of five to conduct the congress.

"Car Full" and "Limited Stop" Signs are [illegible] on street cars [illegible] from [illegible] points. The "car full" sign is shown at the discretion of the [illegible], and while [illegible] the cars stop to [illegible] passengers, but will take on no more. The "limited stop" sign is used during the evening rush hours and cars carrying [illegible] not stop to let off passengers until reaching a point some distance out, but stop to take passengers on before reaching that point.

An Architectural Competition for the Australian Parliament House, [illegible] the site of the new federal capital of Australia, has been announced. Designs must be delivered in London or in Australia by Mar. 11, 1915. Prizes totaling [illegible] are offered, the first prize being [illegible]. The judges are [illegible] of Australia, John James Burnet, of London and Glasgow; Victor Laloux, of Paris; Otto Wagner, of Vienna; Louis H. Sullivan, an American architect, with offices in the Auditorium Tower, Chicago, Ill.

Reconsideration of the Passaic Gas Case is [illegible] New Jersey Board of Public Utility Commissioners [illegible] the [illegible] Passaic [illegible] "Engineering News," [illegible] 1913, but the Public Service Gas Co. appealed. The State Supreme Court [illegible] the commissioners [illegible], but the highest court (Errors and Appeals) recently reversed the decision. The vote was [illegible] to [illegible] and the [illegible] a hearing by the full court. [illegible] will be [illegible]

The City Manager Plan will be voted on at Los Angeles, Calif., on Dec. 31, as a part of a charter amendment which also provides for a city council composed of a mayor and eight other members, all elected at large. The manager would be appointed by the council and would in turn appoint ten department directors, as follows: Public works, public service, harbor, library, health, public utilities, playground, park, fire, and finance. There would also be a city clerk department, under the manager, but the clerk would be nominated by the mayor and confirmed by a majority of the council. The mayor would also nominate and the council affirm a city prosecutor, city treasurer, two police commissioners, five civil service commissioners and nine art commissioners. The people would elect (besides the mayor and councilman) an attorney, auditor, assessor and seven members of a board of education.

An Anti-Civil-Service Policy has been adopted by the West Chicago Parks Commission in restricting employment to residents of the park district. This commission has control of the parks on the West Side. Its argument is that the parks are for the people of that district and that competent employees can be found in its population. Representatives of several civic organizations have appeared before the Commission to protest against this as contrary to the civil-service principle and adverse to the interests of the city as a whole. It was pointed out that, even if this restriction should be applied to ordinary labor positions, it should not be applied in regard to administrative and technical positions, as it would tend to exclude men of competence and special training.

The Bloor St. Viaduct at Toronto, Ont., is to be built of steel, as was noted in our Construction News section of Dec. 17. The contract for the Don section has been let to Quinlan & Robertson for $947,076.01. This viaduct has been the subject of considerable controversy. An effort was made to have it designed in concrete, but the city authorities would not accede to this demand, and made an official design comprising two sections of steel arch viaduct. They, however, permitted alternative concrete designs to be submitted. For the Don section 10 designs were submitted, five of which were on the official steel design and five on special concrete designs made by the bidders. The steel bids varied from $996,500 to $1,353,000 for the steel bridge with the lower deck completed, and from $849,000 to $1,250,000 for the concrete bridge of the same general nature. The accepted bid of $947,076 was for a steel bridge with the lower deck to be completed in the future. The bidder had the low bid also, that is, $996,500, for the steel bridge with a lower deck completed. The Works Commissioner, R. C. Harris, stated in presenting the bid that none of the concrete designs fully complied with the requirements laid down in the advertisement.

Rebuilding the Edison Plant at West Orange, N. J., after the destructive fire of Dec. 9 ("Engineering News," Dec. 17, 1914) is proceeding as rapidly as possible. T. L. Condron, M. Am. Soc. C. E., of Chicago, has been retained by Thomas A. Edison as consulting engineer in the reconstruction work. The first step toward rebuilding was the leasing of two complete cement-gun outfits from the Cement Gun Co., of New York City. It is the intention to use these machines in repairing the damaged columns and girders, though the precise methods of repair have not been fully decided upon. Steel window sash with wire-glass are already being installed in some of the burned-out buildings. The phonograph record building is being inclosed with these windows, and the job will be finished in about two weeks, comprising some 125 windows 12x8½ ft.. Remarkably rapid work is reported in this connection. The order for the sash was received by the Trussed Concrete Steel Co. on Dec. 12; regular factory-type "United" sash, with lights 12x23 in., three swing sections per bay, were called for. Six days later, on Dec. 18, the first lot of sash was shipped from Youngstown, Ohio, by express, and was delivered the following morning, so that some sash were already erected by noon Dec. 19. By Dec. 22 nearly 40 openings had been fitted with sash, and the erection will be completed soon after Jan. 1. The glazing will be Syenite wire-glass. The American Concrete Institute has appointed a special committee to investigate the behavior of the concrete buildings in the Edison plant. The committee consists of Cass Gilbert, the well known architect, chairman; E. J. Moore, of the Turner Construction Co., New York, secretary; Walter Cook, architect; J. Max Taylor, architect; R. P. Miller, of the New York building department; W. H. Ham, engineer, of Boston; Prof. Charles L. Norton, of the Massachusetts Institute of Technology; Richard L. Humphrey, consulting engineer, of Philadelphia, Penn.

Changes in Sewage-Treatment and Pumping, Columbus, Ohio—Acting under orders from the State Board of Health to stop discharging sludge into the Scioto River, plans are being prepared for two-story or Imhoff tanks, and for sludge-drying beds. For the past two years sludge has been discharged into a gravel pit, but the sludge is flooded at high water. It is expected that the new tanks will give so much better sedimentation than the present ones that no changes or enlargements in the dosing chambers and sprinkling filters will be necessary—at least not until they have been well tried with the improved effluent. Money for the proposed improvements has not yet been appropriated, but it is expected that the council will authorize bonds after the plans have been approved by the State Board of Health. The general design for the new tanks was made by Clarence B. Hoover, Chemist and Superintendent of the Sewage Purification Works and Pumping Station, and the construction details are being worked out by J. J. Morgan, Commercial Building, Columbus, Ohio. The Columbus Sewage Works were shut down on Nov. 15 for the balance of this year, on account of lack of city funds to run this and some other city departments.

The sewage pumping station is being remodeled. Under a contract let early in November to Dravo & Doyle, Pittsburgh, the old steam pumps will be replaced by three motor-driven centrifugal pumps of 15,000,000-, 10,000,000- and 5,000,000-gal. capacity, working under a 40-ft. head. Current to drive the pumps will be bought from the municipal lighting plant at 1½, 1¼ and 1c. per kw.-hr. for each successive 25,000 kw.-hr. and ¾c. for all above that, bringing the average price slightly under 1c.

A Coöperative Agreement has been made by the California Water Commission and the U. S. Secretary of Agriculture, to facilitate approval of applications for water rights and occupancy of forest-reserve lands in the development of power. Whenever application for permit for a water-power site is filed with the U. S. District Forester, in San Francisco, notification will be given the commission. When permit to appropriate water is sought from the commission, and use of the water involves occupancy of forest-reserve lands, the U. S. District Forester will be notified and such permit not issued until a complete application for use of the U. S. forest lands has been filed. The commission will defer final approval of such a permit until the District Forester advises that final application for occupancy has been filed or a preliminary application granted with rights to do construction work. The District Forester will confer with the commission before arranging terms of a preliminary permit and file copies of permits as issued. Preliminary occupation permits will allow construction work only in emergency or to comply with state law, and then only upon approval of the commission. Final permits for a site will be issued by the Forester only after the commission has approved the appropriation of water or disclaimed jurisdiction. If the times between beginning and completion of construction, provided in a state water-appropriation and a federal site-occupation permit, are different this will not affect, under state law, the permittee's liability or the cancellation of water right. Loss of state water right, through failure to begin construction, will be sufficient cause for revocation of federal site permit. If either the District Forester or the commission shall fail, within 60 days, to notify the other of action contemplated above, then the one reporting may act without securing notice.

PERSONALS

Mr. Herman Watson has resigned as Superintendent of the Water-Works of Kalamazoo, Mich.

Mr. Heinrick J. Freyn, M. Am. Soc. M. E., has resigned as Third Vice-President of H. Koppers Co., Chicago, Ill.

Mr. William W. Marr, M. Am. Soc. C. E., Consulting Engineer, of Chicago, has been appointed State Highway Engineer of Illinois, to succeed Mr. A. N. Johnson, M. Am. Soc. C. E., who resigned some months ago.

Mr. E. A. Humphrey, Assistant Electrical Engineer of the Great Northern Ry., has been promoted to be Electrical Engineer, succeeding Mr. C. L. Daugherty, recently appointed Assistant General Manager of the St. Petersburg (Fla.) Light & Power Co.

Mr. Layton F. Smith, M. Am. Soc. C. E., Engineer-Architect, Baltimore, Md., has been appointed representative of the city of Baltimore and the Merchants' and Manufacturers' Association, of Baltimore, on the "Link the Americas" cruise, which has in view the bringing into closer contact the business people of South America and the United States. This cruise will leave New York, Jan. 29, and return to that city May 11, 1915. The cruise will entirely encircle the continent of South America, and stops will be made at all the important cities on both coasts. Return will be made through the Panama Canal.

OBITUARY

[illegible] S. [illegible], a civil engineer of York, Penn., died Dec. [illegible] at the [illegible] County Hospital, Hagerstown, Md., aged [illegible] years.

[illegible], Assistant Director of the Pekin Kalgan Ry., of [illegible], China, who was sent to this country by the government of China to study railway management, died Dec. 13, at [illegible], N. Y., after an illness of two months.

[illegible] A. [illegible], Assoc. Am. Inst. E. E., Engineer of the [illegible] Telephone Co. of Canada, Ltd., died at his home in Montreal [illegible] Dec. 7, from pneumonia. He was born in Montreal in [illegible]. He graduated from the Worcester Polytechnic Institute in mechanical engineering in 1889 and in electrical engineering in [illegible]. The same year he joined the staff of the Bell Telephone Co. at Toronto, Ont. In 1895 he went to Montreal as engineer.

[illegible] H. Jackson, formerly a civil engineer of note and in the later years an amateur artist of some fame, died on Dec. 15 at his home in Boston, Mass., at the age of 81 years. He was born in Watertown, Mass., and before the Civil War was employed as an engineer by the City of Boston. He served in the 13th Massachusetts Volunteer Infantry as a Captain throughout the Civil War, and subsequently carried on a private practice as a civil engineer, having his office in the [illegible] Building, Boston. Capt. Jackson spent the later years of his life in painting, and although self-taught he was considered an artist of considerable ability. He was a member of the Boston Art Club.

Henry S. Hayward, M. Am. Soc. M. E., Consulting Engineer of Floating Equipment of the Pennsylvania R.R., New York City, died Dec. 14 at Augusta, Ga., aged 70 years. He entered the [illegible] department of the Pennsylvania R.R. in 1873 as a [illegible] and draftsman. For many years he was Assistant [illegible] and later Superintendent of Motive Power of the United R.R. of New Jersey. In 1912 he had been Consulting Engineer of Floating Equipment of the Pennsylvania R.R. with headquarters in New York City. He was a charter member of the American Society of Mechanical Engineers. He is survived by a son, Henry S. Hayward, Jr., M. Am. Soc. M. E., Consulting Engineer, 30 Church St., New York City.

ENGINEERING SOCIETIES

COMING MEETINGS

AMERICAN SOCIETY OF AGRICULTURAL ENGINEERS.
Dec. [illegible] Annual meeting at Chicago, Ill. Secy., F. M. White, Madison, Wis.

SOCIETY OF CONSTRUCTORS OF FEDERAL BUILDINGS.
Jan. 4-6. Convention at Washington, D. C. Secy., T. R. Maul, 4213 Westminster Ave., Philadelphia, Penn.

ASSOCIATION OF GOVERNMENT CONTRACTORS.
Jan. 4-7. Annual meeting at Washington, D. C. Secy., Algernon Blair, Montgomery, Ala.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.
Jan. 1[illegible]. Annual meeting at New York City. Secy., J. R. Wemlinger, 11 Broadway, New York City.

AMERICAN WOOD PRESERVERS' ASSOCIATION.
Jan. 19-21. Convention at Chicago, Ill. Secy., F. J. Angier, Mt. Royal Station, B. & O. R.R., Baltimore, Md.

AMERICAN SOCIETY OF CIVIL ENGINEERS.
Jan. 2[illegible]-21. Annual meeting in New York. Secy., Charles Warren Hunt, 220 W. 57th St., New York City.

AMERICAN SOCIETY OF HEATING & VENTILATING ENGINEERS.
Jan. [illegible]-22. Annual meeting at New York City. Secy., J. J. Blackmore, 29 W. 39th St., New York City.

INDIANA ENGINEERING SOCIETY.
Jan. 21-23. Annual meeting at Indianapolis. Secy., Charles Brossmann, 1616 Merchants Bank Building, Indianapolis, Ind.

ILLINOIS SOCIETY OF ENGINEERS AND SURVEYORS.
January 27-29. Annual meeting at Springfield, Ill. Secy., E. E. R. Tratman, 1131 Monadnock Block, Chicago.

AMERICAN CONCRETE INSTITUTE.
Feb. 9-12. Convention at Chicago, Ill. Secy., E. E. Krauss, Harrison Bldg., Philadelphia, Penn.

AMERICAN CONCRETE PIPE ASSOCIATION.
Feb. 1[illegible]-16. Annual convention at Chicago. Secy., E. S. Hanson, 538 South Clark St., Chicago, Ill.

Association of Highway Commissioners of the United States—This Association was organized at a recent meeting in Atlanta of the American Road Congress. Its first meeting was held on Dec. 12 for the purpose of electing officers and of discussing Federal highway legislation to be taken up by Congress during the present session.

Montana Institute of Municipal Engineers—The third annual meeting of the Institute will be held at Helena, Mont., Jan. 18-2[illegible]. Among the papers to be presented are the following: "Publicity and the City Engineer," by Henry Herbers; "Objects and Use of Testing [illegible] for Paving," Wm. [illegible]; "Present Status of the Pollution of Waterways in Montana," Prof. Wm. M. [illegible]; "The Experimental Sewage [illegible]," Carl C. Widener. The secretary is Carl C. Widener, [illegible], Mont.

San Francisco Association of Members of the American Society of Civil Engineers—At the [illegible] regular meeting of the Association the address of the evening was given by Prof. [illegible] on the [illegible] Tower at the University of California, Berkeley, Calif. [illegible]

A Card-Index Multiplication Table

Sir—In your editorial remarks on my letter of Oct. 29, published in your issue of Nov. 19, you say of my card system of multiplication:

> Products up to 9 × 999 can be read directly. Beyond that simple multiplication followed by addition is required.

I think if you had understood more fully the purpose of the device, you probably would have said:

> Beyond that by a proper manipulation of the cards any two numbers (no matter how large) may be multiplied together by simple addition. Also, the device may be used for performing division by simple subtraction.

F. C. WILLIAMS.

Commercial Bank Building,
Cleveland, Ohio, Nov. 24, 1914.

REVIEWS AND NOTES

An English Translation of a German Gas-Engine Book

REVIEWED BY H. E. LONGWELL*

HIGH-POWER GAS ENGINES—By H. Dubbel. Translated from the German, and Edited and Expanded so as to Include British Engines and British Practice by F. Weinreb. New York: D. Van Nostrand Co. Cloth; 7x11 in.; pp. xii + 197; 423 illustrations and 13 folding plates. $5, net.

The author has been a frequent and acceptable contributor to the *Zeitschrift des Vereins deutscher Ingenieure.* Inasmuch as he has been able to satisfy the critical editor of that journal, it is more than probable that the book as originally written was a reasonably good one. One cannot conscientiously say as much of the translation. Evidently, it has suffered considerably at the hands of the translator who claims to have "edited and expanded" it. Notwithstanding the translator's expressed obligations to the gentleman "who read and corrected the first English version of the manuscript in a most thorough manner," the style is so obscure and the punctuation so bad that in many places the text is unintelligible.

The work is copiously illustrated with detail drawings and diagrams, most of which have appeared on a larger scale in sundry European technical journals during the past twelve or fourteen years. These illustrations, in connection with the generous size of the pages, and the excellent quality of the typographical work, give the volume an attractive appearance that makes the worse than mediocre quality of the text all the more noticeable.

We are advised, on p. 18, that "the thermal efficiency is found from the heat consumption in the B.t.u. per i.hp. per hour *for which the usual value is from 478 to 504 B.t.u. per i.hp. per hour*" (italics mine). To engineers who have been laboring under the impression that the heat consumption of an engine of 100% efficiency is not less than 2545 B.t.u. per hr., these figures indicating efficiencies of over 500% will be a trifle startling. The probable explanation is that in translating calories into British thermal units the ratio, approximately 3.96, has been used as a divisor instead of a multiplier.

We find in detail, p. 85, the calculations for determining the size of the air and gas pumps for a two-cycle gas engine of 800 b.hp. The result of the calculations indicates that *the displacement of the gas pump should be somewhat greater than that of the working cylinder.* This on its face is, of course, ridiculous. A critical examination of the calculations shows that the displacement of the air pump was first determined, and the displacement of the gas pump was fixed by multiplying the displacement of the air pump by the ratio of gas to air in the working mixture. The trifling incident of some 40% of the air being used for scavenging purposes, and not requiring to be mixed with gas, seems to have been overlooked.

These examples will suffice to indicate the inexcusable carelessness displayed in the preparation of the work.

As an illustration of the effectiveness with which words may be used to conceal an idea, the following quotation, p. 31, is submitted:

> When quantity governing is adopted, the mixing valve may close at no load at the beginning of the suction stroke, and at full load at the end of the suction stroke. The time available for governing will then last up to the time of ignition during a crank travel of 180° to 360°. If the governing is effected by throttling, the time available for governing will only last during 180° before the ignition point, and the governor therefore has to act quicker.

Most engineers imagine that governing by throttling *is* quantity governing; and they will wonder why the

*Consulting Engineer, Westinghouse Machine Co., East Pittsburgh, Penn.

governor can act only during that part of the revolution in which there is no inflow of fluid to be acted upon.

Speaking of the action of the governor on the inlet valve-gear of blowing engines the author says, p. 34:

With [illegible] governing the gas valve remains open during the whole suction stroke and therefore gas enters the cylinders [illegible] during each minute quite independently of the number of revolutions per minute, one suction stroke taking place every four strokes.

The amount of gas entering the cylinder per minute when the speed is reduced therefore remains the same as at the higher speed if the inlet area remains constant, as the gas is supplied above atmospheric pressure.

Note the second paragraph!

Evidently the author is not familiar with the common expedient of using a regulating apparatus in the supply line to maintain the gas pressure constant and substantially equal to that of the atmosphere.

Even the descriptions of the illustrations are not free from error. In describing the cylinder construction of a well known American engine, p. 112, it is stated that "the internal cylinder and external jacket are cast together." Anyone with reasonably good eyesight can see, from a casual inspection of the drawing, that the jacket is a separate casting.

In Chapter XI, on Stuffing-boxes, we are gravely informed that "when arranged in a vertical direction the packing can be adapted to the rod," which doubtless will be a comforting assurance to the designer of gas engines.

In Chapter XIV, on Starting, we have the following:

Fig. [illegible] shows a compressed air starter (Krupp). The piston valve admitting the compressed air is moved by a hand lever.

When compressed air is used for starting it is generally delivered by an independent auxiliary air compressor, and [illegible] at a pressure of from [illegible] to 3[illegible]0 lb. per sq. in. These receivers have to be provided with water [illegible] to prevent [illegible] on the ignition plugs.

When the reader turns to Fig. [illegible], and sees that it illustrates a simple compressed-air motor acting on the flywheel and exhausting into the atmosphere, he is naturally at a loss to understand how the compressed-air supply can have any effect on the ignition plugs.

As will be gleaned from the foregoing extracts the quality of the book—or rather its lack of quality—is such that a detailed outline of its contents and general plan would not be of much interest.

[illegible]

latent heats, entropy, etc., which take into account fundamental thermodynamic relations, (2) checking constants to agree with the most reliable data, and (3) arranging equations in simple form and so that modifications to compensate for new data will make slight changes.

A New Edition of Murdock's "Strength of Materials"

Reviewed by Lewis E. Moore*

STRENGTH OF MATERIALS—By H. E. Murdock, Irrigation Engineer, United States Department of Agriculture. Second edition, revised and enlarged. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. Cloth; 5x8 in.; pp. xv + 314; 137 illustrations. $2, net.

The first edition of this book was reviewed in these columns on Jan. 18, 1912. The new edition is virtually identical with the old, with two added chapters on reinforced-concrete beams and columns.

The chapter on reinforced-concrete beams is clearly written and the author very carefully points out the assumptions made, and indicates plainly that reinforced-concrete design is by no means mathematically exact. The most generally accepted theories are developed and explained lucidly, although the common assumption that the resultant of the compression stresses in a T-beam acts at the mid depth of the slab is not mentioned.

The chapter on reinforced-concrete columns is little more than a résumé of the generally accepted principles of design for such members. The author wisely does not attempt to deduce any mathematically exact formulas for columns of this class.

PLANE SURVEYING: For Use in the Classroom and Field—By William G. Raymond, M. Am. Soc. C. E., Dean of the College of Applied Science, State University of Iowa. Second edition. New York and Chicago: American Book Co. Flexible leather; [illegible]

The original edition of Prof. Raymond's book was reviewed in these columns, Dec. 31, 1896. Until now the book has undergone no changes. In revising the book the author seems to have kept the original method and style throughout, although some additions and changes have been made in the text.

In reviewing the original edition we commended the book for the fullness and clearness of its text, and although many books on surveying have since appeared, this may still be said to rank among the first in these desirable qualities. [illegible]

[illegible]

*[illegible]

already issued extend to 800 pages. The revised work is characterized by Prof. R. DeC. Ward (Howard University), in *Science* of Nov. 27, "as the master-work on the science of the earth's atmosphere."

Express Company Service

THE EXPRESS SERVICE AND RATES—By W. H. Chandler, Assistant Manager, Traffic Bureau, The Merchants' Association of New York. Chicago: LaSalle Extension University. Cloth; 6x9 in.; pp. v + 340. $3.

The intricacies of the transportation system comprised by the services of the many express companies in this country were once a complicated puzzle to which few, if any, had the keys before these independent and secondary agents were specifically put under federal regulation on the same basis as the railroads. The several reports of the Interstate Commerce Commission have opened up the situation marvelously and made possible still further study by such interested students as the author of this work.

Mr. Chandler's treatise is a part of a home-study course in interstate commerce and railway traffic. The first part of the work covers the early history of the express industry, its organization, capitalization, earnings, internal organization, character of service rendered, relations with railroads, etc. Unfortunately, this was written before the recent liquidation of the United States Express Co. and the consequent transfer of its routes to other concerns.

It is known in a general way that the entire express service of the country has been radically changed since the Interstate Commerce Commission was given control. How this has come about and what it now means is well approached by a short review of the common-law attitude, the various state attempts to regulate the business, the powers of the Interstate Commerce Commission and the practices that needed its attention. Then follows the new rate system, prescribed by the Commission and in force for at least two years.

Chapters follow on the special services of the express companies—money order and financial, order and commission and foreign. Finally, there is a brief exposition of the undeveloped electric-road express, the influence of the parcel-post competition (which the author shows is not so fundamentally serious as imagined and may decline once the novelty has worn off), and of Canadian tariffs.

A POPULAR TREATISE ON THE COLLOIDS IN THE INDUSTRIAL ARTS—By Prof. Dr. Kurt Arndt, Private-Dozent at the Technische Hochschule, Berlin, Germany. Translated from the second enlarged German edition by Nahum E. Katz, Chemist to the Eagle Cotton Oil Co., Meridian, Miss. Easton, Penn.: The Chemical Publishing Co. London, England: Williams & Norgate. Cloth; 5x7 in.; pp. 72. 75c.

In as nontechnical language as could be expected without going to an extreme, the author presents, as he says in his Preface he aims to do, *"a Vivid Picture of the Great Significance* which the Colloids have in numerous important practices." The book is all the more interesting because the knowledge of colloids is so new, the word itself having been "first used by Th. Graham half a century ago to denote various substances which, indeed, chemically, have nothing to do with glue, but which resemble in appearance the soaked-up cabinet-maker's glue."

Besides colloids in the hydraulic-cement industry, in sewage purification, lubricating grease, varnishes and soap, the author tells about their relation to ruby and other glasses, silver and gold mirrors, ceramics, tungsten lamps and a variety of other things.

The book can be read in an hour and bids fair to amuse and instruct many who have noted the increasing use of the word colloids in various technical discussions, but who have felt that the subject was beyond the ken of ordinary mortals—if, indeed, it was really understood by anyone.

A New Book on Steam Engines

Reviewed by Winslow H. Herschel*

MECHANISM OF STEAM ENGINES—By Walter H. James, Assistant Professor in the Department of Mechanical Engineering, and Myron W. Dole, Instructor in Mechanical Engineering, Massachusetts Institute of Technology. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. Cloth; 6x9 in.; pp. viii + 170; 183 illustrations. $2, net.

Until some other form of prime mover is developed which can be started, stopped and reversed with the speed and facility of a steam engine, this old and reliable servant of man will continue to be a suitable subject of instruction for each succeeding generation of students. The steam-engine designer must be acquainted with the relative motion of parts, or kinematics, the action of the working fluid and the strength of parts to resist the forces to which they are subjected. The elementary treatise of James and Dole deals mainly with the kinematics of the problem, though indicator cards and valve diagrams are treated briefly so as to make the whole subject clearer to a student whose previous knowledge was derived from casual references to steam engines in a book on the elements of mechanism. The book might well be called "Valves and Valve-Gear Mechanisms." One chapter is devoted to typical problems of the slide-valve engine, but otherwise no problems are given. In a subject requiring graphical solutions, a student may sit and study almost indefinitely without any certain knowledge as to whether or not he understands what he reads. But let him try to solve some problem and he will soon realize whether he can find the answer. It is therefore most desirable that a book on valve-gears should be well supplied with problems. The last two chapters are devoted to the mechanisms of steam turbines, a subject not usually found in a book on valve-gears. While keeping within a small compass, the book explains, with a minimum amount of mathematics, all the kinds of steam-engine mechanisms that would be usually met with. It is to be regretted, however, that the authors have not fulfilled the promise of the introduction to deal with the kinematics of other machines, such as pumps and compressors, since this is a much neglected subject about which very few elementary textbooks are available.

An interesting report of ten printed foolscap pages on "Investigations of Land Settlement and Irrigation Development in America" was made under date of June 29, 1914, to the Minister of Water Supply of Victoria, Australia, by Elwood Mead, Chairman State Rivers and Water Supply Commission (Treasury Gardens, Melbourne, Victoria, Australia). The report is based on a recent visit by Mr. Mead to the United States and Canada. It outlines irrigation conditions in Victoria, as well as in North America, and deals with some problems common to both continents. The "closer settlement" pol-

*Assistant Physicist, Bureau of Standards, Washington, D. C.

ing and irrigation of Victoria, with its loans to settlers, is approved by Mr. Mead. The financial troubles of American irrigation development are commented on, and are summarized as follows:

(1) Construction of works before the demand for irrigation or means also to pay for it.

(2) Failure to [illegible] of small capital to overcoming initial obstacles.

The report concludes with some agricultural and horticultural notes, based mostly on observations in California.

British Methods of Factory Management

Reviewed by Rossiter R. Potter*

FACTORY ADMINISTRATION AND ACCOUNTS. A Book of Reference with Tables and Specimen Forms, for Managers, Engineers and Accountants.—By Edward T. Elbourne, Department Works Manager to the Birmingham Small Arms Co., Ltd. With Contributions on "The General Problems of Industrial Works Design," by Andrew Home-Morton, M. Inst. C. E., of Home-Morton, Ker & [illegible], and "Financial Accounts," by John Maughfling, Secretary to J. Thornycroft & Co., Ltd. New York and London: Longmans, Green & Co. Cloth; 7x10 in.; pp. xv + [illegible]; illustrated. $7.[illegible], net.

It should be mentioned first of all that this is primarily a reference book, a sort of encyclopedia of methods. It is analytical in the extreme, in the sense that it delves deep into the small details of management. For example, a page and a half, mostly in fine print, is devoted to the proper duties of a factory gatekeeper, with a specimen set of gatehouse regulations.

The book is divided into six chapters or sections. The first section (only 25 pages) appears to be the contribution of Andrew Home-Morton and deals with the general problem of industrial works design, including the [illegible] of old works. In this chapter appears the interesting admission that the subject of factory design being well thought out there is much better understood in the United States than in Great Britain. Section II takes up General Administration; III, Works Administration; IV, Works Accounts; V presents an exhaustively complete collection of routine forms, and Section VI a definite set of financial accounts for a large manufacturing concern. The forms shown in these last two sections are made to harmonize in a general way with the ideas set forth in the preceding sections.

Sections II and III, on general administration and works administration, cover about the same ground as the various American books on "scientific management." The author's attitude is sane and conservative and he puts things in a way that can be accepted even by those inclined to harshly criticize the more rabid type of efficiency promoters. The subject is dealt with here, however, rather more from the viewpoint of the business man than from that of the engineer. Section IV (Works Accounts) covers the same field as American books on cost keeping. [illegible] American writers on this subject in advocating the [illegible] rate as the most nearly exact practical method for apportioning indirect expenses or "oncost" as [illegible]. About 75 pages in this section are devoted to the problem of [illegible] or stock taking and to the valuation of buildings and equipment.

The book is well arranged to facilitate quick reference to any desired item, and there is an exceptionally complete index. The table of contents is printed with two columns to the page, one sub-topic to a line. With this arrangement, the contents of a whole chapter can be noted almost at a glance, so that the table becomes of really usable value in supplementing the index. This is a feature that might well be imitated in all technical books. The table of contents of the prevailing style, with subtopics run together in solid paragraphs, is so slow and painful an affair to use that nobody ever thinks of consulting it when looking for anything in a hurry.

The chief use of this book for American readers will be for reference and comparison when establishing new rules and methods or revising printed forms. The differences between British and American conditions, laws, shipping facilities, etc., are of some effect in reducing the book's value. American managers will entirely forget their own comparatively trivial worries while reading of the snarl of red-tape and "system" necessitated by the British national health insurance act, applying to practically all working people between the ages of 16 and 65. All things considered, this book will have to be classed as a luxury rather than a necessity in this hemisphere, but those who can easily afford it to use for reference only will doubtless get their money's worth.

*[illegible]

GRAPHIC METHODS FOR PRESENTING FACTS.—By Willard C. Brinton. New York: The Engineering Magazine Co. (Works Management Library.) Cloth; 7x10 in.; pp. xii + 371; 256 illustrations. $4.

While figures cannot lie, when marshaled in sufficient number and complication they can often present a pretty fair semblance of deception. For this reason it has long been a practice among statisticians to reduce their figures and facts to a graphic concentration that permits of easy and rapid understanding of the data. It is a part of the engineer's business to be familiar with such graphic presentations but there are many quirks and turns in the statistician's graphical methods with which the engineer rarely comes in contact. Mr. Brinton's book is of value to the engineering profession mainly on this account. To the statistician it probably has greater value, but on that score we are not so competent to judge.

Briefly, the book is a conscientious effort to give all of the various methods of graphic representation. This necessarily includes the ordinary curves and diagrams and the higher cumulative and mass curves, frequency curves, etc., with which the engineer is familiar. In addition it comprises the different photographic and pictorial representations of comparative figures and the various curve forms which are adapted to business enterprises, such things as cost and production records. In addition to being very interesting, the book should make a valuable reference, for from the text an example may be found of any proposed type of graphical representation.

UNIT CONSTRUCTION COSTS. From the New Smelter of the Arizona Copper Co., Ltd.—By [illegible]. New York and London: McGraw-Hill Book Co., Inc. (Republished by Special Arrangement with the American Institute of Mining Engineers.) Cloth; [illegible]; pp. [illegible]; illustrated. [illegible]

This is by far the most specialized cost-data book which has ever come to our attention. It is purely and simply a list of cost sheets giving unit-construction costs of the building of the Arizona Copper Co.'s new smelter at Clifton, Ariz. Practically its only value is in the design and construction of a smelter plant, though possibly some of the detailed figures may be of use in other types of work.

A Handbook in a New Field

HANDBOOK OF CONSTRUCTION PLANT; Its Cost and Efficiency—By Richard T. Dana, M. Am. Soc. C. E., M. Am. Inst. M. E., Consulting Engineer. Chicago: Myron C. Clark Publishing Co. London: E. & F. N. Spon, Ltd. Flexible leather; 5x8 in.; pp. 702; 312 illustrations. $5.

The vast business of contracting is gradually acquiring a literature, but the process is slow and hard. Mr. Dana's book is, however, quite a forward step in developing that literature. Possibly the most important single thing in a contracting operation is the plant, and the cost of that original plant and the cost of operating it are factors upon which contracting failure or success depends. It has been Mr. Dana's object to reduce to lowest terms such itemized costs. These are presented in this book in alphabetically arranged sections, and the list includes practically every machine or device which can be used in contracting work.

Merely to glance through that list we might name the following headings as an indication of the type of subjects considered: Air Compressors, Asphalt Distributors, Automobiles, Bar Benders, Barges, Blacksmith Batteries, Boots, Cableways, Cameras, Carts, Conveyors, Crowbars, Derricks, Drawing Tables, Dredges, Drill, Explosives, Fuse, Hammers, Hydraulic Giants, Ladders, Log Chains, Mauls, Pile-Drivers, Poles, Pumps, Rails, Roofing, Saws, Scows, Spreaders, Switches, Tarpaulin, Teams, Traction Agents, Unloaders, Wagons, Wheelbarrows. Under each of the headings, of which the above list is only a small part, is given a recent series of prices, a brief description, sometimes with illustrations, of the device, and in most cases some cost data with a brief description of the work on which it is used.

The book is valuable for any one estimating on construction work—provided, of course, that they combine with the figures given in the book a fair knowledge of local conditions and of the business in which they are engaged, so that they may temper the printed words with personal authority. As the author truly says in the preface, no book can tell a contractor automatically what equipment is the best for his use, but it is possible to put him in possession of vastly more information than has heretofore been available, and this has been attempted in the present volume.

RURAL IMPROVEMENT: The Principles of Civic Art Applied to Rural Conditions, including Village Improvement and the Betterment of the Open Country—By Frank A. Waugh. New York: Orange Judd Co. London: Kegan Paul, Trench, Trübner & Co., Ltd. Cloth; xi + 265; illustrated. $1.25, net.

Professor Waugh gives much sensible advice on how villages and outlying sparsely settled districts may enter more largely into the benefits which come from intelligent city and town planning, modern sanitation and community improvement generally—physical, economic and social.

In the opening pages more is said about civic art and the beautiful than is likely to be relished by some people who read the book, but the doctrine is sound. Elsewhere the author tends to mislead the uninformed to put too much faith in the septic tank as a means of sewage treatment, and to think that macadam roads are not only the ideal to which every community and country-side should look forward but also that they can be built for $3500 to $4000 a mile. These dangers are perhaps more than offset by repeated advice to call in the engineer or other competent professional adviser wherever and whenever problems outside the ordinary are met.

A moderate number of line and halftone engravings, for the most part well chosen, add to the interest and value of a book which deserves wide circulation in the rural districts, villages, and even in many so called cities of the United States and Canada.

SURVEYING MANUAL: Designed for the Use of First-Year Students in Surveying and Especially for the Use of Non-Civil Engineering Students—By Howard Chapin Ives, Professor of Railroad Engineering, Worcester Polytechnic Institute. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. Leather; 4x7 in.; pp. viii + 296; 56 text figures and numerous plates. $2.25, net.

Like many similar texts this "surveying manual" is chiefly in the form of specific instructions to students for performing certain surveying problems. Included are brief descriptions of instruments and discussions of their adjustments, a brief chapter on the elements of railroad curves, one on the United States system of laying out public lands, on computations, on plotting, and a few pages on astronomy. About 100 pages of tables for stadia reduction, logarithms, trigonometric functions, etc., add considerably to the practical value of the book, but even then a book of this type, of which there are a great many, is not sufficiently complete or practical to be of any permanent use to the field engineer.

For students of civil engineering who must ultimately own larger and complete texts on surveying, and books of formulas and tables such as Searles' "Field Engineering," these various elementary surveying manuals seem a little superfluous, although the use of them unquestionably eases the work of the instructor. Surveying is nothing but the application of geometry and trigonometry to the ground under our feet by the use of implements and instruments, and the principles involved are generally very simple and easily understood. Detail instruction for simple problems may be essential with some students, but such instruction is merely a substitute for a very elementary knowledge the student should have before he begins his course in surveying.

Space is given in most of those manuals, and we believe in most engineering schools considerable time is also given, to exercises with the surveyor's chain, which is obsolete so far as real engineering work is concerned. It is very doubtful if the old-time Gunter's chain can be found anywhere nowadays except in the instrument rooms of technical schools, and whatever value the experience in using it may be to the student, just as much good could be had by following the same exercises with a steel tape. The reduction of old-time surveys in chains and links to feet and tenths is much more easily performed on paper than with a chain in the field.

A history of the American Society of Mechanical Engineers from its organization in 1880 to the present year, has been compiled for the Society by Prof. F. R. Hutton, who, by his 24 years' experience as Secretary of the Society, is best able to write with authority on the subject. The history, which is now ready to go to press, is to be published by subscription, and will be a book of 200 pages, uniform in style with the Society's "Transactions."

A new periodical, entitled "Structural Conservation," appeared under date of October, 1914, as Vol. I, No. 1. According to its editorial page, its mission is threefold, educational, instructional and discussional, and its main purpose is to educate its readers in the fundamental and underlying principles of waterproofing. The first num-

...er contains an article by A. R. A. Plumb on "Structural Waterproofing and Dampproofing", another by Myron H. Lewis, on "Waterproofing as a Problem in Conservation," and a third by A. D. Hyman, on "Theoretical and Practical Considerations in the Successful Application of Waterproofing." Other brief articles are not signed. The new periodical is edited by E. G. Frank and is published in Detroit on the 15th of each month, but the publisher is modest; nowhere in the first issue can we find his name or the address of the publication office.

Notes on the Examination of Lubricants

EXAMINATION OF LUBRICATING OILS—By Thos. B. Stillman, Late Professor of Engineering Chemistry in the Stevens Institute of Technology. Easton, Penn.: The Chemical Publishing Co. London: Williams & Norgate. Cloth; 6x9 in.; pp. iv + 125; illustrated. $1.25.

Prof. Stillman's comprehensive collection of notes on the laboratory examination of lubricants will be welcome to a wide range of readers, so far reaching is the use of scientifically prepared oil and grease compounds and so difficult is prior assurance that they will prove adapted to the expected service.

The several tests are presented in the following order: specific gravity, congealing, viscosity, iodine absorption, flash and fire temperatures, acidity, temperature and color action under acid, separation of mineral and vegetable or animal oils, gumming, sulphur content, water content, gasoline solution, microscopic scrutiny, carbon residue, paraffin content, soap content, saponification value, tar content, coefficient of friction, rape-seed and cotton-seed content, cylinder-deposit analysis, scrutiny of petroleum, and the behavior of lubricating oils in saturated and superheated steam, air, carbon dioxide and other gases.

Although the volume is of uncommon value, yet it is to be regretted that there could not have been more care and time spent on the finish of the text, which gives evidence of a hasty assembly of disjointed notes. It is decidedly inconvenient to have various general specifications for miscellaneous oils and greases scattered through the book and attached to one test or another which forms but a part of the specified examination. Thus, some lard-oil specifications are appended to notes on "acid test," and several railroad oil specifications follow "friction tests," though a few follow "cold tests." There are some obvious errors in words and figures which will cause faint doubts in the mind of the inexperienced reader on the complete accuracy of other statements.

THE CLEANING OF BLAST-FURNACE GASES—By [illegible]. New York and London: [illegible]. Cloth; [illegible]

The aim of the author to place on record in easily available form, the latest information of cleaning blast-furnace gas is commendable. The book should be interesting to all [illegible] in cleaning these the gases that have been taken to secure a clean waste gas from which power may be developed economically and continuously.

The author first outlines the demand for clean [illegible] gas which [illegible]. Then the theoretical aspects of cooling and [illegible] are presented. The cleaning processes and apparatus are described under three heads: (1) first-stage or dry-dust catchers; (2) second-stage or wet cleaners and coolers; (3) third-stage or final cleaners. The first-stage machines described are the "centrifugals" and the "whirlers." The second-stage equipment covers coke and grid scrubbers, baffle and spray towers, slow rotary washers, high-speed centrifugal washers. The final-stage equipment includes centrifugals, "disintegrators" (combination fan sprays), washers, bag houses, water-coil towers with screens and baffles, and the Cottrell electric-precipitation scheme. Much of the apparatus described is European, so that the author has found it advisable to append a chapter on operative plants in America.

A New Edition of Foerster's Taschenbuch

REVIEWED BY LEON S. MOISSEIFF*

TASCHENBUCH FUR BAUINGENIEURE—Herausgegeben von Max Foerster, Geh. Hofrat, ord. Professor an der Technischen Hochschule in Dresden. Second edition. In two parts. Berlin: Julius Springer. Cloth; 5x8 in.; pp. xvi + 2078; 3054 text figures. 20 marks.

To attempt the publication of a new civil-engineering "pocket book" in German after the famous "Hütte" had attained its twentieth edition and was expanding into a third volume was a daring act on the part of Prof. Foerster, as well as on that of his publisher. The new book met, however, the demand so well that the first edition was exhausted in three years and a second and an enlarged one has been published.

This civil engineers' pocket book is in 27 divisions, each representing in a condensed form the established knowledge of the treated subject. It covers the entire field of civil engineering and even contains a very substantial treatise on machinery generally used in connection with civil-engineering work and a short one on the principles of law. This wealth of information is condensed on twenty-one hundred pages and illustrated by more than three thousand figures, forming a book which requires a very substantial pocket to contain it. Like most modern works of its kind, it is a result of the coöperative efforts of more than a dozen specialists. With a few exceptions, the book is a product of the Dresden Polytechnic School and in many ways it displays characteristics distinct from the Berlin center of engineering influence.

Engineers familiar with the works of Prof. Mehrtens, the dean of the Dresden Polytechnic School, will be pleased to learn that four hundred pages have been written by him. Prof. Mehrtens deals with the theory of trusses, graphical statics, strength of materials, and the statics of structures. He also covers the field of steel bridges. It is needless to add that the treatment is lucid and practical.

Prof. Foerster, who is well known by his book on steel buildings and his comprehensive treatise on building materials, has chosen for his subjects the theory of reinforced-concrete construction, building materials, and the structural elements of steel buildings. The important subject of hydraulic engineering, exclusive of water supply and sewerage, is treated by an eminent authority in Prof. [illegible].

Chapters have been added in the new edition on harbor building, on special structures of reinforced concrete, and

*Engineer of Design, Department of Bridges, Municipal Building, New York City.

as foundations, bins and reservoirs, and on city planning.

A judicious introduction of numerical examples serves to enhance the usefulness of the book. The book is well gotten up and is a fine example of German efficiency.

Ore Deposits

IRON ORES, Their Occurrence, Valuation and Control—By Edwin C. Eckel, Assoc. M. Am. Soc. C. E. New York and London: McGraw-Hill Book Co., Inc. Cloth; 6x9 in.; pp. xvii + 430; 66 illustrations. $4, net.

THE DEPOSITS OF THE USEFUL MINERALS AND ROCKS; Their Origin, Form and Content—By Prof. Dr. F. Beyschlag, Geh. Bergrat, Direktor der Kgl. Geolog. Landesanstalt, Berlin; Prof. J. H. L. Vogt, an der Universität, Kristiania, and Prof. Dr. P. Krusch, Abteilungsdirigent a. d. Kgl. Geolog. Landesanstalt u. Dozent a. d. Kgl. Bergakademie, Berlin. Translated by S. J. Truscott, Associate Royal School of Mines, London. In Three Volumes. Vol. I, Ore-Deposits in General—Magmatic Segregations—Contact-Deposits—Tin Lodes—Quicksilver Lodes. London: Macmillan & Co., Ltd. New York: The Macmillan Co. Cloth; 6x9 in.; pp. xxviii + 514; 291 illustrations. $5, net.

The annual output of iron is of more than twice the value of any other metal produced: so far as tonnage is concerned iron is 19 times as important as all other metals combined. These and many other facts of popular interest are given in the opening chapter on the industrial status of iron. Likewise the whole book is of much more interest than its title indicates, for the author has admirably fulfilled his intention to discuss iron ores "not merely in their geologic and technical relations, but in their more general relations to industrial conditions." Consequently, the book is of value not only to mining engineers but to all engineers.

Part I, on the origin of iron-ore deposits, contains chapters on the geologic and chemical relations of iron; the iron minerals and their relationship; the formation of iron-ore deposits; sedimentary or bedded deposits; replacements and cavity fillings; alteration deposits; igneous iron deposits. Part II is on the valuation of iron-ore properties, containing chapters on the basal factors in ore valuation; prospecting and tonnage determinations; mining conditions and costs; furnace and mill requirements; composition and concentration of iron ores; ore prices, profits and markets; the effect of time on valuation. Part III treats of the iron ores of the world in 11 chapters. Part IV is on the extent and control of iron-ore reserves and contains much information of general interest. The estimated iron-ore reserves of the world are given and the bearing of these estimates upon the probable future development of the iron industry is discussed. This part of the book cannot fail to be of interest to every student of the world's progress and future, and certainly engineers should be in this class.

The second book listed above is the first of three volumes of an apparently very complete and exhaustive treatise on ore deposits of all minerals. The work is done with characteristic German thoroughness and will undoubtedly prove of the greatest value as a reference book to those readers who are unable to read the original German text, which was published in 1909.

GEOLOGICAL AND TOPOGRAPHICAL MAPS, THEIR INTERPRETATION AND USE: A Handbook for the Geologist and Civil Engineer—By Arthur R. Dwerryhouse, Lecturer in Geology in the Queen's University of Belfast. London: Edward Arnold. Cloth; 6x9 in.; pp. 133; 90 text figures. $1.25, net.

While intended primarily for the twofold purpose of those who make maps and of those who interpret maps of topographical and geological features, this little textbook contains as much geology as the average civil engineer stands much in need of. As it is an English textbook, the illustrations and conclusions are based on the British Ordnance Survey, and hence must be modified somewhat to correspond with American practice. The main part of the book is an explanation of the principles of geological formations and their representation on paper. There is also a chapter on methods of conducting a geological reconnaissance.

NEW PUBLICATIONS

[So far as possible the name of each publisher of books or pamphlets listed in these columns is given in each entry. If the book or pamphlet is for sale, and the price is known by the editor the price is stated in each entry. Where no price is given it does not necessarily follow that the book or pamphlet can be obtained without cost. Many, but not all, of the pamphlets, however, can be secured without cost, at least by inclosing postage. Persons who are in doubt as to the means to be pursued to obtain copies of the publications listed in these columns should apply for information to the stated publisher, or in case of books or papers privately printed, then to the author or other person indicated in the notice.]

AIR, WATER, AND FOOD FROM A SANITARY STANDPOINT—By Alpheus G. Woodman, Associate Professor of Food Analysis, and John F. Norton, Assistant Professor of Chemistry and Sanitation, Massachusetts Institute of Technology. Fourth edition, revised and rewritten. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd. Cloth; 6x9 in.; pp. 248; illustrated. $2, net.

"AMERICAN EXPORTER'S" EXPORT TRADE DIRECTORY FOR 1915: A Complete List of the Export Commission Houses, Foreign Buyers, Manufacturers' Export Agents, Foreign Exchange Banks and Bankers, Marine Insurance Companies, Export Truckmen, Foreign Freight Forwarders, etc., in All the Principal United States Ports; Also Foreign Consulates in the United States, American Consulates Abroad, etc.—Compiled Under the Supervision of, and with Explanatory Notes to the Various Sections, by B. Olney Hough, Editor "The American Exporter." New York: The Johnston Export Publishing Co., 17 Battery Place. Cloth; 6x9 in.; pp. 369. $3, postage paid.

ANALYSES OF MINE AND CAR SAMPLES OF COAL COLLECTED IN THE FISCAL YEARS 1911 to 1913—By Arno C. Fieldner, Howard I. Smith, Albert H. Fay and Samuel Sanford. Bulletin 85. Washington, D. C.: U. S. Bureau of Mines. Paper; 6x9 in.; pp. 444.

REPORT OF JOINT COMMITTEE ON VALUATION OF OHIO PUBLIC UTILITIES, Under Order No. 176 of the Public Utilities Commission of Ohio, 1914—Cleveland: Andrew P. Martin, Secretary, 620 Illuminating Bldg. Paper, 6x9 in.; pp. 4[illegible]. [illegible]c.

After the orders of the Ohio Public Utilities Commission requiring that inventories and valuations be furnished it, the several state associations of various utilities combined their efforts, through a joint committee, to make a formal statement of principles to be followed. The statement finally agreed upon is fairly brief and follows the method of "reproduction cost new less depreciation." The report defines (1) property used and useful, (2) reproductive cost, (3) period of theoretical production, (4) working capital, (5) unit costs, (6) overhead costs, (7) apportionments, (8) depreciation methods, and (9) depreciation reserves. The report also gives an inventory outline and explains the various items.

Preliminary Report on Emscher Tanks and Kindred Sewage-Clarification Processes*

By Prof. Dr. K. Thumm and Prof. Dr. Eng. C. Reichle†

(1) The Formation of Acid Sludge in the Sludge-Digesting Chamber

As is well known, good Emscher tank sludge has a deep black color given to it by ferrous sulphide, and will naturally react alkaline, as it is impossible for ferrous sulphide to exist with free organic acids, as occur in sludge. It has a peculiar, not disagreeable, odor, somewhat like sealing wax, and is easily drained. The water contained in this sludge, which can be easily filtered off through filter paper, is more or less clear and colorless, does not smell putrid, contains ammonia and free carbonic acid, and reacts alkaline, as all normal, clarified or raw sewage does.

But occasionally the sludge from Emscher and similar clarification plants is of an altogether different quality, especially if it has been left in the sludge chamber for a few months. It is not black, but yellow, like milk-feces, grayish yellow or gray, has an evil smell, is very difficult to drain, has a distinct acid reaction, containing none or very little ferrous sulphide. The water contained in such a sludge has some ammonia, but has, like the sludge, a more or less but always distinct acid reaction, and finally the water as well as the sludge in the whole chamber will show this acid reaction.

Emscher tank sludge drawn from tanks that are in the process of ripening has, like the above described acid sludge, a gray to gray-black color, but the reaction of this sludge and the water in it is alkaline. The water is easily filtered off, the nearer ripe the tank is the easier the sludge can be drained.

With the preponderance of carbon hydrates and a small amount of nitrogen combinations, such as ammonia and other bases, acid sludge must be expected with every method of separate sludge digestion, and later on, as the acid reaction progresses, also acid water. A preponderance of nitrogen combinations or other acid-neutralizing matter assures the formation of alkaline sludge and alkaline water in the sludge-digesting chamber. From sludge and water, which have only small acid-neutralizing ability, an acid sludge is to be expected. Great acid-neutralizing ability will guarantee good Emscher tank sludge having an alkaline reaction.

We have already pointed out the necessity of the right mixture of sludge and sewage to obtain a good sludge, in a report which we made in 1908, on our West End test plant with a modified Emscher tank, a so called Kremer-Imhoff tank. The agitator, mentioned in this report, was ready for operation in the summer of 1909. In the meantime, numerous troubles occurred, bad sludge, spitting and frothing and the formation of scum. The installation of the agitator and its daily use brought an alkaline and better sludge. We tried to overcome the frothing and the scum formation by a timely withdrawal of sludge, but in spite of this sometimes the whole contents of the sludge-digesting chamber threatened to boil over. After long consideration, it was decided to drain off the water in the sludge-digesting chamber. This was done in December, 1910. The sludge-digesting chamber was refilled from the top with clean water from the municipal water system and the sedimentation chamber refilled with sewage; the usual operation was then resumed. A week later we had for the first time a fully satisfactory typical Emscher tank sludge and it continued to be of the same good quality until the plant was discontinued during the summer of 1913. The operation of the sludge-digesting chamber, to which no more clean water was added, was as follows:

The agitator was run for a short time every day. On every Saturday, an exact predetermined amount of sludge was withdrawn from the sludge-digesting chamber. Care was taken that after the withdrawal of the sludge, the proportion of sludge and water in the sludge-digesting chamber remained in the ratio of 1 : 2. Frothing and the formation of injurious scum did not occur again.

The principal conditions which lead to the formation of good sludge are, in our opinion, quite clear. The proportion between water and sludge and between acid-neutralizing agents and sludge must be right; the mixing of the parts, by agitators, if necessary, must be thorough, if the plants are expected to ripen and the formation of acid sludge is to be avoided. Regular withdrawal of sludge, of proper amounts, will assure good operating results. The sludge-drying beds should be so arranged and partitioned that the sludge can be easily measured. The operation should include frequent tests as to the reaction of the sludge and the supernatant water. It should be taken into consideration that not only organic acids, but also carbon dioxide, mineral acids and sometimes acid salts, are able to cause an acid reaction.

(2) The Formation of a Scum and the So Called Frothing or Spitting of a Sludge-Digestion Tank

The causes and the detrimental influence of the following phenomena have to be judged differently, depending on whether the sludge considered is already ripe or still in the ripening period. The difficulties on account of the formation of a heavy scum cover are greatest in the latter case.

A skin of microörganisms and particles of fat are formed on an ordinary covered septic tank, rising sludge sticks to this, and the cover gradually increases in thickness. With purely domestic sewage only a floating cover is formed, with practically no layers in suspension. If storm water only is handled, suspended layers only are found.

Sludge in the digestion chamber of Emscher tanks and kindred installations is originally settled sludge from the sedimentation chamber. Sludge that forms the sludge cover obtained its floating properties only in the digestion chamber, a property due to its entrained gases of decomposition. The rising to the surface, and remaining there, of single sludge particles or whole sludge cakes, is doubtless dependent on the composition of the raw sludge in the sludge chamber and the intensity of the gas formation (proportional to the unit area of chamber). Fresh sludge will act differently than putrifying sludge, the latter causing less floating scum.

to dump into the can, making a vast improvement over the old-style hand shovel, still used by sweepers in most cities to pick up street refuse.

FIG. 4. PICK-UP CAN MADE BY THE FERRER MANUFACTURING CO., NEW YORK CITY

A Railway Mail-Transfer System for collecting and dropping mail bags from trains has been adopted for the Chicago and St. Louis line of the Chicago & Alton R.R. At each mail exchange station there will be a shallow concrete trough about [illegible] ft. long, with [illegible] and above [illegible] track [illegible] the [illegible] from the track. This is to receive the bags dropped from the mail cars. Above it is a platform carrying the mail cranes to which are attached the bags to be picked up by the trains. The crane [illegible] horizontal arms, attached to the top and bottom of the bag. There is a crane for each bag [illegible] can be taken by one train.

A special feature of the system is that the [illegible] the [illegible] is operated from the [illegible] the axle [illegible] into gear by means of a track trip so that it is independent of the attention of the mail clerks. [illegible] the trough [illegible] to the [illegible] for collecting the bags and also [illegible] the chute containing the bags [illegible]. The chute [illegible] vertical position [illegible] the trough so that the bags [illegible] might drop are caught by the trough.

When the crane [illegible] comes to a [illegible] automatically. When the [illegible] is arranged [illegible] stand clear. A lever in the [illegible] position [illegible] independent [illegible] of a system [illegible] existing mail [illegible] enable the [illegible] to be operated [illegible]. The apparatus is made by the [illegible] Mail [illegible] Co. of Chicago.

the sanitary officer. As before stated, sewage from the mechanics' quarters discharges into a septic tank. The upper town discharges its sewage into a septic tank with filter beds.

Amusements

Realizing that a contented employee renders more efficient service, the question of amusements has received considerable attention in this camp. There is a paid Y. M. C. A. secretary, who devotes a large part of his time to the creation of amusements. A high-class amateur orchestra gives frequent free concerts; baseball teams have been organized; frequent dances are given at both camps; tennis courts and croquet grounds are maintained; a boy-scout class gives diversion to the boys who have in ordinary camp life little to amuse them; each camp has a pool table, and a reading room. Also, as before mentioned, there is the moving-picture theater and the ice-cream parlor. Secret orders have built lodge halls.

Conclusions

Three years of experience in this camp has led the writer to the following conclusions:

That anything tending to create a better moral or sanitary environment increases the efficiency and output of the employee.

That the price of good sanitation is an eternal fight—a continuous campaign.

That good sanitation, even though expensive, pays a good return—besides it is humanitarian.

That perfect disposal of camp wastes will produce the millennium in camp life—a flyless camp.

That liquors are not only useless and undesirable in camps, but a real detriment from every point of view.

That examination as to physical fitness is not only practicable, but advisable.

That under average conditions private stables should not be maintained, and that there must be an eternal fight for cleanliness.

An Exhibit of Modern Street-Cleaning Apparatus: Refuse Collection

Supplementing the article and illustrations in Engineering News of Dec. 3, pp. 1139-1143, describing the exhibit of street-cleaning apparatus held in New York City, Nov. 23-29, under the auspices of the New York Street Cleaning Department, of which John T. Fetherston is Chief, we present herewith some illustrations and brief descriptions of special apparatus for refuse collection.

Figs. 1 and 2 show two styles of dust- and odor-proof wagons for refuse collection, such as have been used in German cities for at least ten years. They are made by Anton Fügert, Karlsbad-Fisshern, and were exhibited by H. Kastor, New York City, American agent. In the wagon, Fig. 1, the refuse is dumped into the rectangular cans hung on the sides, which are hinged to the wagon body, so that in lifting the cans up the covers of the cans and those of the wagon body open simultaneously and the material is handled without exposure to the air. The wagon itself has a bottom-dumping arrangement. Fig. 2 shows a truck with steel cans which are designed to be lifted off and dumped into a refuse destroyer.

Fig. 3 shows a type of odorless, dustless dump cart with can-dumping device similar to that used in the wagon shown in Fig. 1. This was exhibited by the City Street Cleaning Department and was made by Charles Putzel, of New York City. Other forms of dustless wagons had canvas tops. Obviously, any and all of them are great improvements over the open dump cart, which is now

Fig. 1. Ash and Refuse Collection Wagon of the Dustless, Odorless Type Used in Europe

well as the health feature may be mentioned here. There has been a determined effort in this camp on the part of the construction engineer to limit to the very minimum the importation of liquors. The effort has yielded a fine return. There is practically no drinking, and a drunken man is so rare an exception as to occasion great surprise. It is generally known throughout the camp that drunkenness or intemperate drinking will result in the dismissal of an employee. Early in the work it was stated that such strict rules would handicap the Service in securing workmen. It seems to have had the opposite effect.

Sanitary Department

The question of sanitation at Elephant Butte has naturally resolved itself largely into a relentless war upon the fly, and the efficient removal of stable, human, and kitchen wastes. In this camp a stable owner is required to keep his corral well cleaned, failure resulting in the

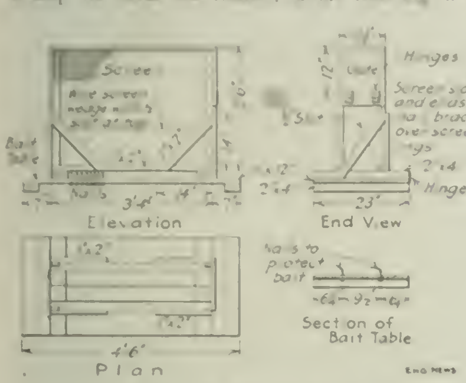

Fig. 5. Fly-Trap Details

work being done for him at his expense. The second offense cancels his permit to keep horses.

The matter of abolishing all private corrals in this camp is under advisement. Should this be done, persons who still desire to keep horses will be required to stable same in the government corral, for which a maintenance charge will be made. Hesitation along this line arises chiefly from the fear that such drastic action might affect the labor question, on account of the fact that a great many of the laborers are from the villages and ranches at a considerable distance, and come to camp in wagons.

However, it is believed that this course would effectually do away with the fly nuisance. It is noted that fly traps at the government corral catch but few flies, the reason being that the wastes are carted off every morning and there are no breeding places. It is also to be noted that at the upper camp, where there are no corrals, flies are so scarce that screens are almost unnecessary.

Fly traps are placed here and there about the camp, and in this way millions of flies are caught. These traps are put in place at the very earliest moment of spring, when flies begin to breed. Fig. 5 shows a trap of great fly-catching capacity. It is believed that the ceiling of these traps should be painted white and the floors of a dark color, carrying out a little further the idea that the fly after feeding on the bait will have just so much more light above to aid in his extinguishing, and after feeding he moves to the point of greatest light.

Garbage Disposal—The disposal of garbage and general camp wastes in a camp composed largely of foreigners by hand forces, becomes a rather simple matter, but where a camp assumes the nature of a small city of 2500 people, chiefly foreign, where you have all the problems of village sanitation except that enforcement, you have then confronting you a complex problem.

Some 150 garbage cans are stationed about the camp, requiring 425 barrels. All camp refuse, except a part of the kitchen garbage, is dumped into these receptacles and carted to a specific dumping yard, at which point it is burned. All such wastes are removed by a man who is paid a small salary, but who depends chiefly for his income upon the food value of the slops, which he removes to a remote point and feeds to hogs.

It is believed that the garbage cans mentioned are a very small source of fly breeding, for two reasons: First, the frequent removal; and second, that practically all cans are used in the disposal of a great amount of wood ashes. Just how to keep flies off garbage cans is as yet a problem. If each family had an individual can, responsibility could be placed and the solution would be easy, but since garbage cans are community affairs, no one family can be held accountable.

Night-Soil Disposal—The location of the greater part of this camp is such that a complete sewer system with septic tanks and filter beds is impracticable, although desirable. The only disposal practicable is by means of the ordinary privy vault. This has necessitated the building of many privies.

At first these were built on ordinary lines with screened gables and screened doors, and self-closing lids. The latest privy design has such a seat that fouling, ordinarily a source of much trouble, is impossible. A solid door, hung inside, now replaces the screen door, which, when closed, keeps the vault fairly dark, so that flies attracted by odors are found near the roof about the screens.

Such a disposal of night soil is admittedly far from ideal, but it seems the most practical method under existing conditions. Privy vaults are treated frequently with chloride of lime. If ground water rises in them, the surface is floated over with crude oil. If particularly malodorous, crude carbolic acid is used.

Inspection—The camp is policed daily by a sanitary officer, who is responsible to the camp physician. This inspector's duties include attention to drainage, the treatment of stagnant pools with crude oil, the destruction of causes of malodors, attention to closets, the spraying of bunk houses with a 10% solution of carbolic acid and Vermicide, twice monthly.

Where fumigation is impracticable, and such is the case where construction is being pushed with three shifts, the use of Vermicide is very effective in clearing a structure from insects, especially bed bugs. In one of the bunk houses the sprinkling of formalin upon the floor has been used apparently to a good advantage in driving away insects of various kinds, and as a deodorant.

Sewerage and Drainage—The camp, as will be seen by the map, is well drained, except a part of the residence section of the lower town, which is so flat and of such extent that sewerage is impracticable. For this part of the camp a system of open drain ditches for surface water is provided, which receive careful attention from

the same style, with double-decked cots, accommodating eight to each tent, are provided for Mexican laborers.

Besides these tent-style bunk houses there are three houses of frame construction, each accommodating 64 men in double-decked cots. These buildings are provided with good ventilation by means of swinging, side-hinged windows between each tier of beds, and by louvers. All permanent bunk houses are screened and provided with electric lights, water and shower baths.

In the American quarter there are three bath houses, 12x16 ft., accommodating the families of this part of the camp. They are equipped with a hot-water heating apparatus, two showers and one tub.

The Reclamation Service has built 26 tent houses and cottages for rental purposes, none of which is ever without occupants. The moving-picture theater and the ice-cream parlor are operated by the Service, and are built solely for the entertainment of the camp. Sufficient revenue only to meet expenses is expected.

Hospital Department

As will be seen from the map, the hospital is somewhat isolated, though conveniently situated near the center of construction activities. The building (see Fig. 4) is of pebble-dashed adobe, well finished and equipped. For the

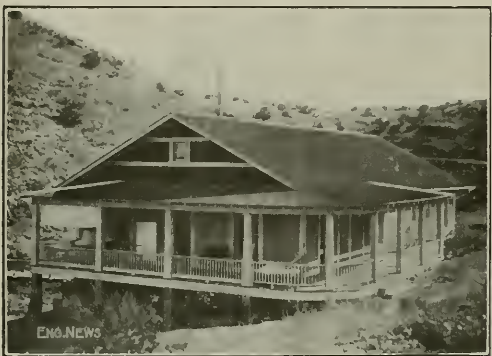

Fig. 4. Hospital Building, Elephant Butte Camp

care of the sick and injured, there are two private rooms and a ward. (A well regulated field hospital should have two or three private rooms on account of the absolute necessity of isolation in many cases.) Beds are furnished for twelve, but more can be accommodated.

The arrangement of the building is such that the reception room can be utilized as a second ward, as has been necessary a number of times on this work. The dining room, kitchen and steam-heating apparatus are in the basement. The operating room is well equipped and splendidly lighted. The dispensary is well filled with such medicines and supplies as are required, besides a few drug sundries, the latter articles, however, being handled chiefly by the commissary.

Besides the physician and nurse, the force includes an orderly and a housekeeper (cook). A contract is also in force with a consulting surgeon, who makes visits on request, assisting in any manner of operation at one specific price.

Stretchers and crutches are stationed at convenient points about the work, as are also small first-aid emergency kits, containing peroxide, cotton and bandages. If the case is one in which actual hospital confinement promises a salutary effect in reducing the days incapacitated to a minimum, the patient is required to remain. Otherwise, he may go home, reporting as ordered for treatment. However, to get credit for meals he must take same at the hospital. If incapacity from injury extends to or beyond 15 days, claim is made for compensation, as provided under the Congressional law.

Immediate report of injury is made on specific blanks, giving name, age, kind of work, salary, character of injury, witnesses and circumstances attending the inquiry. A duplicate of this report is retained. An employee laying off on account of sickness or injury must have an order from the physician before he will be allowed to return to duty.

The physician makes to the engineer, ten-day, monthly and yearly reports, covering the health of the camp, sanitation, number and ratio of days lost on account of injury and sickness, and points of interest in the general management of his department. Drugs and hospital supplies are purchased in large quantities. Duplicates of all orders, invoices and reports are kept on file.

A compulsory deduction of $1 per month is made from each pay check, which entitles the employee to all reasonable dispensary or hospital service. It is found that there is practically no disposition to abuse the privilege. At this time the hospital fund is showing a balance in its favor.

Preventive Measures—The business of the camp physician is not so much to treat the sick as it is to create conditions which will keep sickness at its lowest ebb. To this end, for instance, with the first suspicion of a disease from which there may be possible dissemination, precautions are taken at once without waiting for a positive diagnosis. If the suspected disease is one from which contagion may occur from human wastes, a flyproof receptacle, usually a garbage can, is placed conveniently near, into which all body wastes are thrown, where they receive special treatment before being carted away.

Typhoid prophylaxis through vaccination has been introduced. It may be of interest to note that not an employee has lost a shift from its effect.

Each applicant for work is given an employment slip, which must be O.K.'d by the physician before his name can appear upon the time book. Applicant's age and conjugal condition are taken, and a record made of the notification address, to be used in event of serious sickness or injury.

Physical examination, as practiced here, is more in the nature of an inspection. Gait is noted, eyes, tongue and skin inspected, and examination made for rupture and heart disease. If such examination suggests unfitness, a more thorough one is made. Special attention is given to employees requiring special standards.

It has been urged that contractors would be handicapped in securing labor if insistence was made upon examination as to physical fitness. To disprove this it may be stated that since this system was installed, a little over two years ago, only three out of a total of over 3000 applicants have refused to be examined. There have been as many as 347 examined in one month without any objection whatever. A very few make a mild protest, but a little tact overcomes this.

A matter having bearing both upon the economic as

Fig. 2. Upper Town, Elephant Butte Construction Camp

has 32 rooms accommodating 66 men. A small wing of this building, 16×36 ft., is equipped with 12 shower baths, the usual urinals and lavatories, discharging into a septic tank. This building is equipped with steam heat and electric lights.

The bunk houses in the American quarter are of the tent-house style, 14×16 ft., well screened, and particularly well adapted to the climatic conditions, so far as the comfort of the men is concerned, but ill advised from the economic point of view on account of much necessary repair from time to time. These tents accommodate from two to eight, according to the necessity. Four bunk houses of

Fig. 3. Lower Town, Elephant Butte Construction Camp

Construction Camp, Elephant Butte, N. M.

By J. Dale Graham*

SYNOPSIS—Description of the construction camp of the United States Reclamation Service at the Elephant Butte dam; hospital department; preventive measures, which include the physical examination of every employee, vaccination against typhoid fever; sanitary features of camp; garbage and night soil disposal and fly prevention.

※

The Elephant Butte camp, New Mexico, is composed of 3000 inhabitants, 1200 of whom are employees of the Reclamation Service. The camp is fortunate in being considerably removed from any large city, thereby greatly limiting the danger of contagion through carriers. There are, however, some nearby small villages which have menaced the usual good health of this camp. Experience has shown the value of extending to these villages and towns some manner of inspection (however unauthoritative).

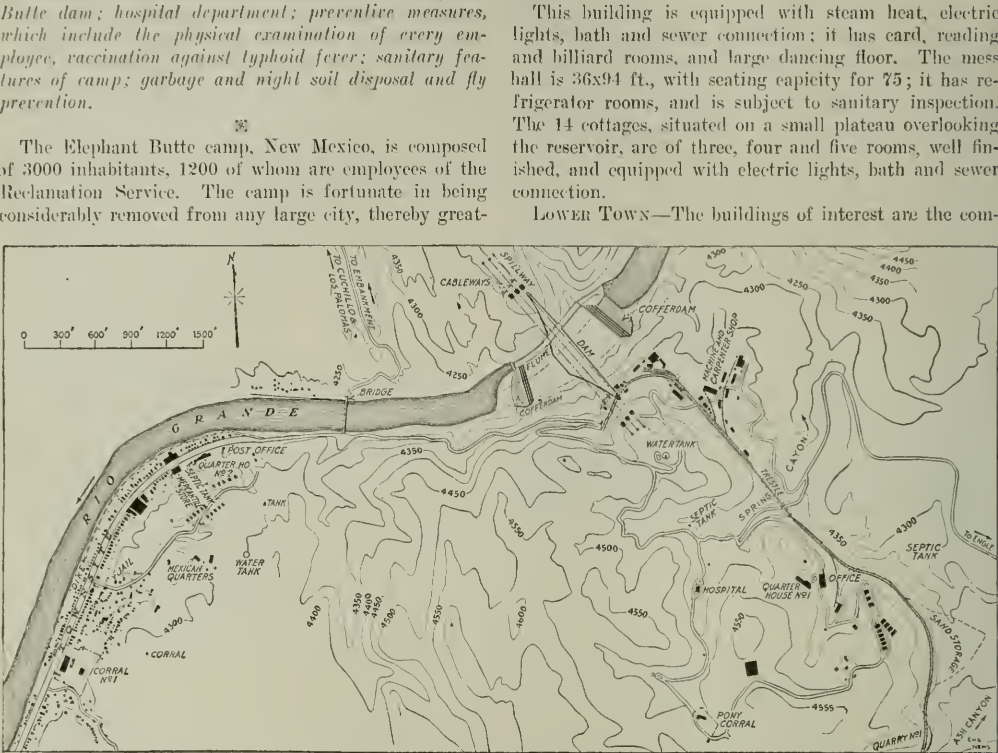

Fig. 1. Map of the Elephant Butte Construction Camp and Surroundings, New Mexico

Description of Camp

Geographically the camp is divided into an "upper town," where the engineering and office force lives, and a "lower town," for the foreman, mechanics and laborers, the latter town being further divided into an American and a Mexican quarter (see map, Fig. 1).

Upper Town—The buildings of interest are the main office, quarterhouse, mess hall, chemical laboratory and cottages, all of pebble-dashed adobe construction (Fig. 2). The main office, 36x110 ft., is the center of all executive work. The quarterhouse, 34x145 ft., two stories, has accommodations for about 50 persons, and is a stopping place for transients, though in no wise considered a hotel.

This building is equipped with steam heat, electric lights, bath and sewer connection; it has card, reading and billiard rooms, and large dancing floor. The mess hall is 36x94 ft., with seating capicity for 75; it has refrigerator rooms, and is subject to sanitary inspection. The 14 cottages, situated on a small plateau overlooking the reservoir, are of three, four and five rooms, well finished, and equipped with electric lights, bath and sewer connection.

Lower Town—The buildings of interest are the commissary, mess, mechanics' quarters, bunk houses, moving-picture theater, churches, school houses, accommodating 420 pupils, and a large number of cottages, government and private (Fig. 3).

The mess hall is 42x126 ft., with seating capacity of 200; it is doubly screened at entry ways, has good ventilation by means of fans and louvers, and is subject to inspection. A hall, 65x42 ft., is a part of this building, and originally was intended as a dining room, but is now used for a Y. M. C. A. headquarters.

The commissary, 57x77 ft., is under government management, and is the only store. It supplies the general mercantile needs of the people at reasonable prices. Vegetables and fruits are kept in season. The meat market, a part of this building, is well screened, and subject to rigid inspection. The ice house and cold storage are also under the same roof. The fact that it requires ten men to do the work connected with the commissary gives some idea of the large volume of business.

The mechanics' quarters, 26x150 ft., 2 stories high,

*Camp Physician, Elephant Butte, N. M.

Widening a Business Street at St. Paul, Minn.

A municipal improvement of an unusual character which is now being carried out in St. Paul, Minn., is the widening of a street through the business part of the city. Robert St. extends north from one of the Mississippi River bridges, and lies in the retail shopping district. It has a heavy team traffic, and is occupied by a double-track street railway for six blocks. The width was only 58 ft., so that traffic was badly congested, and in March, 1912, the City Council passed an order for widening it to 78 ft. from 2nd St. (at the end of the bridge) to Central Ave., a distance of 4227 ft., or about 15 city blocks. Central Ave. is a mall or boulevard 132 ft. wide, which runs in front of the State capitol and will become a part of the general approach scheme.

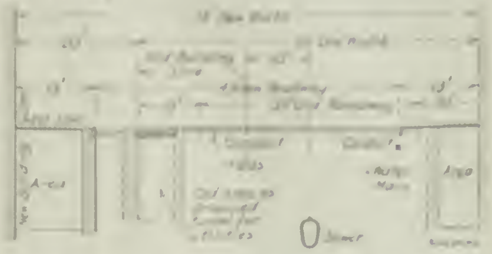
The work is in progress now on the first six blocks, to 8th St., beyond which the street is built up largely with dwelling houses and small stores. The accompanying cross-section shows the general arrangement. It will be noted that it is proposed to cover the old sidewalk-area space with a concrete roof and utilize this as a tunnel for public utilities. This is conditioned upon the public-utility corporations agreeing to use the space, which it seems they will not do.

The widening is done entirely along the west side. Fortunately all the buildings were old, from three to six stories high, and mainly of brick construction with wood floor framing and with light interior iron columns in the stores, etc. The only new building affected had been designed with a view to this change, and had a steel frame at 20 ft. back from the old street front to allow for removal of the outer panel. Under these conditions, it was practicable to cut off 20 ft. from each building and put in a new front of modern type, thus greatly improving the general appearance of the property. Eventually, much of this property will be replaced with larger modern buildings. A 16-story frame building now being built at 4th St. replaces a six-story brick building and its construction was delayed until the widening of Robert St. was undertaken.

All alterations were required to be approved by the Building Department. In the residential blocks, part of the widening will simply take gardens and open ground, some of the buildings may be altered and others may be moved back to clear the new street line.

The total estimated cost of widening the street is $887,000. This includes cutting off 20 ft. from the buildings and replacing a new front, also the value of the 20 ft., the repaving of the street, moving sidewalks, lamps, etc., and consequential damages. Of this amount, $592,000 was assessed back against the property on the west side of the street as benefits, and a bond issue was made to take care of the balance. The assessments were spread 150 ft. each way from the old street lines. The benefits assessed amounted to as high as $700 per front foot between 4th and 5th Sts. The property on both sides was assessed, although that on the east side incurred no expense for alterations.

The property owners in general accepted the conditions in view of the eventual benefits. About 13 appeals were made from the assessment. Only ten of these went into court and six of them have been settled, the city winning three and losing three cases. One of the interesting features in connection with the assessment was that the Merchants' Bank, a [illegible]-story brick building, was allowed $[illegible] damages for moving the front back 20 ft., notwithstanding that the owners were already planning, before the Robert St. widening was completed, to tear down the old building and put up a new [illegible]-story building. The assessments are payable in five annual installments with interest at 6%. The bonds are taken up as the assessments are paid. Damages were paid in several instances to tenants for injuries to business, but these damages were but few.



THE WIDENING OF ROBERT ST. AT ST. PAUL, MINN.

The work was planned under the direction of Oscar Claussen, Commissioner of Public Works.

It is of interest to note that in 1912 a proposition to widen this and other narrow streets in the business district by forming arcades (or sidewalks) along the street fronts of the buildings, was made by Geo. H. Herrold, Assistant City Engineer. The store fronts would be moved back about 15 ft., the supporting columns under the front wall being replaced (where practicable) by columns of uniform design and spacing, so as to give an improved architectural effect. The roadway would then extend the full width between building lines. It was suggested that such arcades or covered walks would be beneficial to the public and the stores, and would not affect the buildings (except at the street level).

Enforcement of Ordinances by Public Officials—The Appellate Court of Illinois, in a recent decision, declared that a public officer in enforcing an ordinance must act as the ordinance provides and has not discretionary powers. A theater building was under construction which embodied violations of the city ordinances, and the work was stopped on this account, but the permit was not revoked by the Commissioner of Buildings, and work was afterwards permitted to be resumed. Suit was brought to compel the Building Commissioner to revoke the permit, to stop the work, and not to issue a new permit until changes had been made to comply with the ordinances. The Circuit Court awarded a writ of mandamus to this effect, but instead of complying with this, the matter was taken to the Appellate Court, which has affirmed the action of the lower court. In the light of this decision, municipal officers are not free to decide for themselves whether or not to follow the duties explicitly prescribed for them by the ordinances. The decision says:

Under the provisions of the ordinances set out in the petition, there is, in our opinion, no liberty or power of discretion conferred upon the Commissioner of Buildings upon his own judgment as to what action is just and proper under the facts and circumstances presented by the petition. The ordinances clearly direct him as to his course of action. Section [illegible] says: "If the work [illegible] in violation of [illegible] this chapter, it shall be the duty of the commissioner to revoke the permit." Another section provides that whenever it shall be found that a structure is being built in violation of any of the provisions of this chapter the Commissioner of Buildings shall [illegible] notify the owners," etc. "If at the expiration of the time specified in the notice the person so notified shall have refused, neglected or failed to comply with the [illegible] order in such notice, it shall be the duty of the commissioner to proceed forthwith to tear down or cause to be torn down such structure." These provisions are mandatory and specific, and leave no room open for the exercise of personal judgment. They command ministerial acts to be done by the commissioner.

It will be noted from Fig. 86 that the arches curve both ways, giving somewhat the effect of a dome. The central third of each arch extending right across the structure, together with a part of the two side parapet walls, was first poured, then when that had set, the two sides between the central third and the cross-girders were poured together. The forms are left in place 28 days and it is expected to use each set of forms three or four times.

For pouring the arches, hoppers are erected above them into which the buckets (Fig. 88), lifted off the cars by the cranes, are dumped (Fig. 89). The concrete is then distributed from the hopper by short chutes as required. For the central section one hopper is used, for the end sections two hoppers, one for each; the central section is placed without top forms, but these latter are required for the steeper slopes of the two end sections.

It is proposed to hammer-finish all exposed concrete faces, using a patent-hammer for all plain surfaces and a bush-hammer for recessed panels. The ends of the cross-girders on top of the columns and the longitudinal panels of the parapet walls are to be faced with colored ornamental tiling.

Ocean Storms at Seabright, N. J.

That Seabright, N. J., is at the mercy of northeast storms is evidenced by the accompanying views of the damage wrought on Dec. 5-6. The force of the water and the weak resistance offered by the puny shore bulkheads provided are plainly shown.

About a year ago two other ocean storms, also accompanied by record tides, all but obliterated the Seabright beach and damage to abutting property amounted to $600,000. At that time Engineering News made an investigation of the conditions at Seabright, and published the findings in the issue of Jan. 8, 1914, p. 102. Practically the same lack of protection exists there today.

A conference was held at Trenton, N. J., on Dec. 16, to devise means for protecting the state seaboard. It was attended by delegates from most of the shore towns.

Fig. 2. Damage Caused by Lack of Adequate Groin Protection
(Note typical bulkhead at right, with waves dashing over it.)

Fig. 1. Proximity of Cottages to Deep Water
(A flimsy groin in foreground; shore bulkhead gone at right; waves pounding shore-property bulkheads.)

was expected to be almost as rapid as any operation; this method should have advantages if successful, as it would avoid lifting the cars or buckets to reach a platform and the concrete dropping into the forms.

As many as 40 batches (30 yd.) have been placed in one hour but the average for an 8-hr. shift is just over 60 to 70 yd., due to delays for shifting forms, shifting the pipe, etc. The work is being prosecuted continuously day and night, three 8-hr. shifts being worked. The average amount of concrete placed is from 165 to 190 yd. per day of 24 hours.

The discharge pipe is 8 in. diameter, flanged and bolted, made of a very mild but tough steel, which is expected to have a life estimated by a capacity of about 4000 cu.yd. passing through it. The present pipe, however, which has been used for the discharge of almost 2000 cu.yd., is beginning to show some signs of wear. This was particularly noticeable at the bottom of the perpendicular drop, and a new bend made of extra-heavy cast-iron segments, bolted together to make a curve of about 5-ft. radius, was installed and seems to work satisfactorily.

Reinforced-Concrete Elevated Railway.

A part of the elevated structure to be built between the Queensboro Bridge Plaza in Long Island City and Corona, is of reinforced concrete. This section, which is 1951 ft. in length, is that which traverses Queens Boulevard, a parkway 200 ft. in width and one of the main arteries of travel from New York City and the Long Island. It was desired to make this an ornamental structure, and the drawing reproduced in the first of this series of articles (Fig. 81) gives an idea of the appearance of the completed structure.

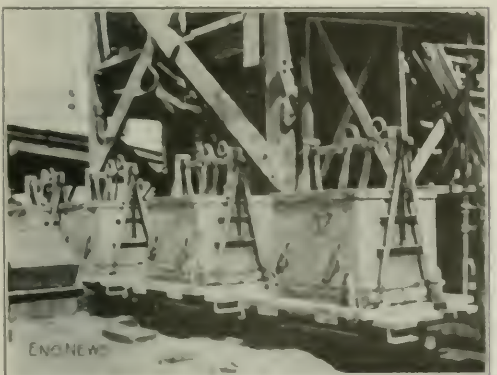

Fig. 88. Concrete Buckets about to Be Loaded

The views in Fig. 85 show the construction of the column foundations, the columns and the abutment at the New York end. A longitudinal section on the center line of the structure through the end abutment, is shown in Fig. 87, and longitudinal and cross-sections of the main viaduct arches and piers in Fig. 86. The type of stations, of which there are three in this reinforced-concrete section, is shown in the perspective drawing already referred to and the details, and particularly the overhang for the platforms, in Fig. 87.

As will be seen by the photographs, the columns were first built up to a point slightly above the springing line of the arches; then the heavy cross-girders at each pier were placed in position, after which the arches and parapet walls were poured.

A central mixing plant for the concrete was established near the New York end with a 1-yd. batch mixer operated by an electric motor with chain drive. The concrete was distributed from this plant by dinkeys and trains of small four-wheel flat-cars each carrying a single 1-yd. double-hinged bottom-dumping bucket. A standard-gage railroad track was first laid the whole length

Fig. 89. Lifting Concrete Buckets into Place, Queens Boulevard Viaduct

of the work, between the two rows of columns. This was used for the operation of two Union locomotive cranes, and for the distribution of material. The cranes were used for various purposes in place of derricks, and for handling the forms and the concrete in the buckets, the latter being picked up off the cars and dumped directly into place. The concrete trains and dinkeys were operated on the 2-ft. gage track laid in the center of the standard gage, during the construction of the piers, five cars being used in each train.

As soon as the construction of the columns was finished, the cross-girders, which weighed 27 tons each, were placed on top of them, being handled by a derrick car, as they were setting sufficiently for the locomotive cranes.

For the construction of the arches, a standard-gage track for the two cranes was laid just outside the westerly row of columns, and a double-track narrow-gage line for the concrete train outside of this. When concreting from 1000 to 2000 ft. away from the mixer, three trains of five cars each were used to distribute the concrete. Clean rounded gravel of fairly uniform size, graded from ¼ to 1½ in., is used for the aggregate, making a mixture which will probably give good results for the proposed hammered finish for the surface.

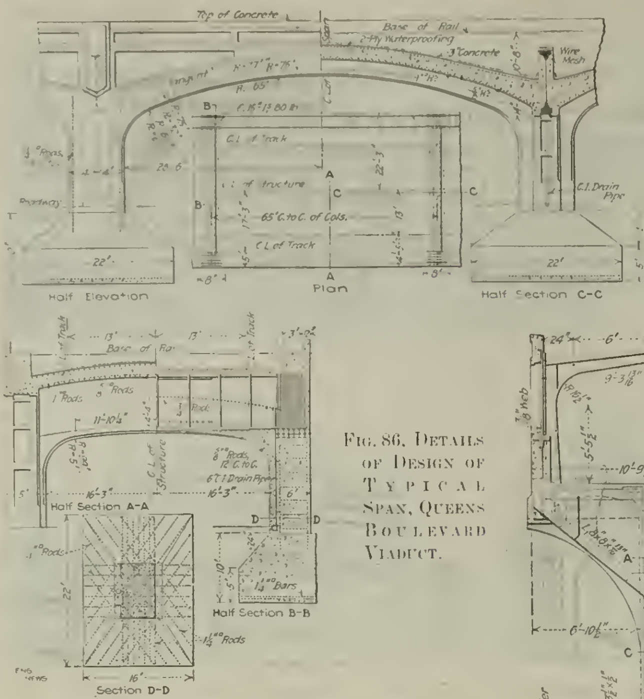

FIG. 86. DETAILS OF DESIGN OF TYPICAL SPAN, QUEENS BOULEVARD VIADUCT.

out removing them. On this section the work is only partially decked over and the track is laid over the open trench. The cars with the buckets are run to the point where the work is being done, spotted over the top of a chute and hopper and each bucket dumped in succession into it.

For the Harlem Tubes, the outer concrete, as has already been described, was mixed by machinery on a lighter and deposited by means of tremies. For the lining of the inside of the tubes, the compressed air or pneumatic system controlled by the Chicago Concrete Placing Co. was tried at the northerly end for a part of the section.

The views in Fig. 84 show the general layout of this plant, which it was expected to use for the lining of half the length of the tubes. It is installed on a platform built over the water. The materials are fed in the proper proportions from the overhead bins into the cylinder of the machine in half-yard batches. Water is added, from a pipe leading into the top of the cylinder at the same time as the dry material enters from above, the quantity being carefully measured, as it is of some importance to get the proper consistency. An air valve is then opened, and used as a blower to clean the gasket forming the seat of the top door which is then closed. Air is then admitted from the second valve over the top of the mixture to seal the top door, and apply pressure behind the mass, then the lower air valve opening into the elbow in the pipe just below the discharge at the bottom of the cylinder is opened, to loosen up the material as it feeds into the pipe, and both these last two valves are kept open until the drop in the pressure shows that the batch has been discharged from the end of the pipe.

Normally, very little, if any, trouble has been experienced in discharging the concrete at distances up to 500 ft., for which an air pressure of about 80 lb. is used, and the material has been carried over 800 ft. in the work, but to do this the air pressure had to be increased to 100 lb. and there were some few difficulties which, however, should be overcome in similar work as the men get used to the apparatus.

On leaving the main cylinder the pipe runs horizontally for 25 or 30 ft., then drops vertically 50 ft. or so to the bottom of the tunnels, and then along the floor to the point of discharge. Only the bottom of the tunnels was put in by this method, which for this kind of work probably has few advantages over any other method. In placing the sides and arch, however, which it

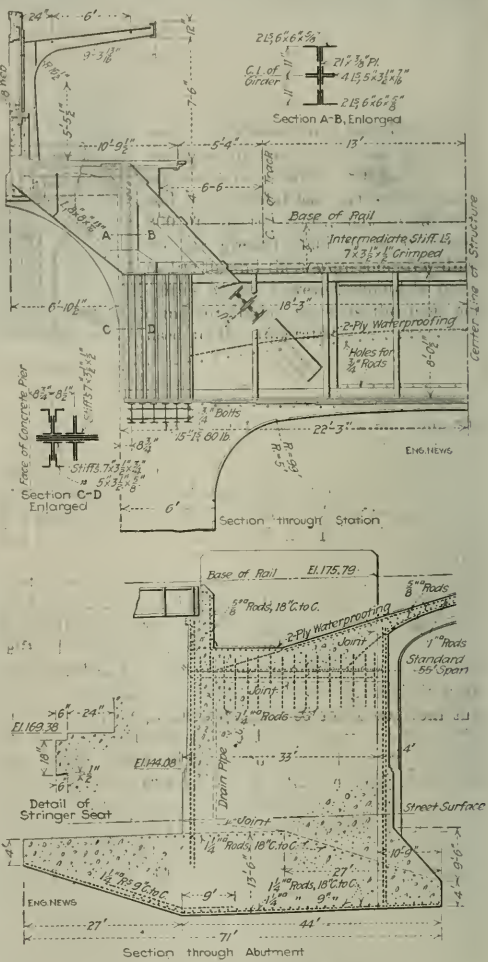

FIG. 87. SECTION THROUGH STATION AND DETAILS OF ABUTMENT, QUEENS BOULEVARD VIADUCT

FIG. 85. VIEWS OF QUEENS BOULEVARD REINFORCED-CONCRETE VIADUCT DURING CONSTRUCTION

(A) Columns completed (B) Foundation for column (C) Column showing forms (D) Abutment at New York end

for both the traveler and the forms were laid on them. The track in one tunnel was used for concrete cars, and in the other for the muck cars. The concrete cars were brought up under the traveler, hoisted by the elevator to the upper platform, from which both arches could be reached. The general layout is shown in the sketch, Fig. 83.

Wooden and steel forms have both been used on all four of these sections; the general opinion seems to be that where there is a length of say over 300 or 400 ft. of lining all of the same section, steel forms of the Blaw type are cheaper and quite satisfactory. The Blaw forms keep their shape quite well under ordinary conditions, but they could not be used to advantage in the sections where continuous support of the ground by posts was necessary, and, of course, not at all in sections where posts had to be left in while the lining was placed and only removed after the arch had taken the weight.

On Sec. 9 motor trucks were used for the concrete, thus permitting the complete mixing with water at the dock, which was possible by reason of the rapid means of transit these trucks provided.

On Sec. 12 a ¾-yd. batch mixer was used, set up along the side of the street and moved along as the work progressed, the concrete being mixed at the point where used. Blaw forms were used, but on account of the continually varying dimensions of structure, were found to be not as easily adaptable as on work where they could be used over and over again without change.

On Sec. 13 the concrete-mixing plant is located at the dock at the foot of 125th St., the average haul to the work being about half a mile. A 2-yd. batch mixer is used, arranged with the necessary bins, etc., for convenient feeding of the materials, and so as to deliver the mixed concrete about 10 ft. above the ground. Two motor trucks with self tipping bodies holding 4 yd. each are used for hauling the mixed concrete to the work. The latter is mixed fairly wet at the mixer, and a little more water is added for cleaning as it is dumped; an air pipe is kept in readiness to be used if necessary, to help get it out and clean the wagon. This is just a short length of 5 or 6 ft. of inch pipe at the end of a hose, capped at the end and with small holes bored in it. It can be pushed into any mass which has shaken down so as to become a little tight and so start it. At the work when a section is ready for concrete, holes are cut in the wooden street decking at suitable intervals and a line of 8-in. [illegible] sheet-metal spouts in 5-ft. sections is hung to lead from the hole in the decking to the forms. The sections are slung one below the other by chains. Over the hole in the decking is placed a wooden hopper 7x10 ft. and 2 ft. deep, into which the truck dumps its load and is away in about two minutes.

The hoppers are on skids and are not connected with the spout or the decking. They are moved by hitching them by a chain to a truck. The trucks make a round trip from the mixer to the place of dumping and return to the mixer in from 15 to 20 min.

On Sec. 15 there is a central mixing plant with a [illegible] batch mixer. The concrete is [illegible] in [illegible] double hinged bottom-dumping buckets, two of which are mounted on a flat-car; two cars are hauled together by a dinkey on 3-ft. gage track. The cars are arranged on the flat-car frame so that they can be dumped through [illegible]

New York Rapid Transit Railway Extensions*

By F. Lavis†

XII--Concrete Work

The total amount of concrete to be used on the whole of the subway construction is, of course, quite large, but speaking generally there is little of the work where there are large masses, or where a great deal is required at one time, so that there are no elaborate plants for turning it out in large quantities. Three general methods are used, a central mixing plant of comparatively small capacity, the material being hauled in motor trucks to the point of delivery into the forms, a portable or movable mixer at the site, and hand mixing on the planking of the roadway immediately over the work. This latter seems an anomaly in these days of the very general use of machinery; but in reality on account of the relatively small amount of material usually required to fill a considerable space in the forms, this latter method in many cases seems to be quite as economical and efficacious as any of the others.

Concreting Plants

The few specific plants and methods described below are fairly typical. On Sec. 8, 10 and 11, Lexington Ave., the concrete was all mixed dry in two 1-yd. batch mixers, at the 96th St. Dock on the East River, from whence it was hauled in wagons holding about 3 cu.yd. to the point at which it was to be used. The use of horse-drawn wagons prevented the addition of the water before hauling on account of the length of time required to make the trip. It was usually dumped on the street decking, water added, and the mixture shoveled into chutes directly into the work in the cut-and-cover sections, or delivered down the shafts into 1-yd. cars for the tunnels. These cars were hauled to the point where the material was to be used and there dumped directly when the material was placed in the floors or footings of the walls, or hauled up a short section of movable inclined track to a platform at about the level of the springing line, where they were dumped and the material shoveled into the forms for the arches and sidewalls.

In one case in the tunnels on Sec. 9, a timber platform was suspended at about the springing-line level from eyebolts, built into the concrete arch. The concrete was delivered into cars at the level of this platform at the shaft, and pushed along a track on it to the point where it was to be used. This required the permanent use of a considerable quantity of timber, however, and after a length of some 300 or 400 ft. had been built this way, a small traveler with an elevator was built to hoist the cars from subgrade level to the springing line. This was in a section where the rock required no support so that the whole section was clear. The platform of the traveler at the springing line reached across both tunnels and was located in the clear excavation ahead of the forms. The footings of the sidewalls were built first and kept ahead, and tracks

and are manufactured by the Cambria Steel Co., of Johnstown, Penn.

THE AJAX GUARD RAIL

This is a self-supporting guard rail of cast-manganese steel, and the casting comprises the guard rail proper, its braces, and the tie-plates which support the track rail. The only additional parts are a spacing block at the middle, and a malleable-iron foot-guard at each end.

FIG. 1. THE MORRISON ROLLED-STEEL GUARD RAIL, CAMBRIA STEEL CO., JOHNSTOWN, PA.

The face of the guard rail is a vertical web, reinforced by a wide top flange and vertical ribs. Slotted spike holes provide for adjusting the position of the guard in relation to the rail. The construction is shown clearly in Fig. 2, while Fig. 3 shows the guard rail in the track.

The rail is made ordinarily 9 ft. 10 in. long, straight for 3 ft. 10 in. at the middle and then flaring outward with a gradually increasing flare, the rail being set with 2 ft. 8 in. of the straight portion ahead of the frog point.

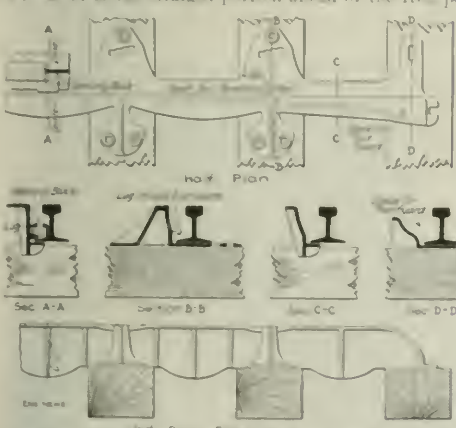

FIG. 2. THE AJAX MANGANESE-STEEL GUARD RAIL, AJAX FORGE CO., CHICAGO, ILL.

It is considered that on the sharp curves of yard turnouts a greater length of straight guard rail is inadvisable, especially as engines designed for No. 8 turnouts are often operated through still sharper turnouts, which leads to distortion of the track.

A special feature is that the guard rails for use on heavy curves are made 1¼ in. higher than the running rail, for the reason that [illegible] with long wheel-base will sometimes [illegible] a heavy side thrust as to [illegible] the weight on one rail [illegible] so that the [illegible] which may lift from the rail. The high guard rail will also engage the [illegible] during [illegible]. The principle is the same as in grooved rails for sharp curves on

FIG. 3. FRONT AND REAR VIEWS OF THE AJAX GUARD RAIL IN THE TRACK

street railways, which are made with the guard higher than the rail head.

This guard rail is made by the Ajax Forge Co., of Chicago, and is in use on a number of railways, particularly at large terminals. They are found to show very little wear after considerable service under severe conditions of traffic, and they require very little maintenance. In some cases, however, it is thought that there is little if any advantage in raising the guard rail above the level of the running rail.

THE MORDEN GUARD RAIL

This also is a manganese-steel casting, but the guard rail proper is of heavy angle section with lugs by which it is secured to cast-steel chairs which carry the running rail also. Thus the only part made of the more expensive manganese steel is that which actually takes the wear. The foot guards are of malleable iron.

The guard rail is 10 ft. long, straight for 3 ft. at the middle and then curving out at each end on a radius of

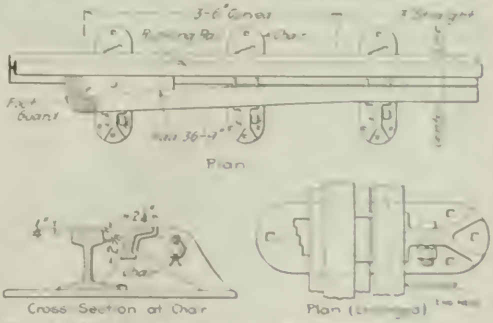

FIG. 4. THE MORDEN MANGANESE-STEEL GUARD RAIL, MORDEN FROG & CROSSING CO., CHICAGO

26 ft. 9 in. The rail when in position is slightly higher than the running rail in order to take the lateral thrust to better advantage. This guard rail, shown in Fig. 4, has been used experimentally. It is made by the Morden Frog & Crossing Co., of Chicago.

to the air for several seconds, resulting in an oxidation of the organic matter in the water, thus removing the cause of taste and odors. The simplicity and small cost of this method are strong arguments in its favor.

The above general remarks apply only to upland soils. Where swamps, bogs or river bottoms, containing deep deposits of alluvial mud form a considerable part of the reservoir bottom, special treatment of some kind will probably be desirable. The following notes describe a simple treatment which gave very satisfactory results and made possible the immediate use of stored water on a swamp area.

Treatment of Swampy Area of Reservoir Bottom

The new Kensico Reservoir, a part of the Catskill water-supply system for the City of New York, which is now nearing completion, is located in the Valley of the Bronx River a few miles north of White Plains, in Westchester County. It is formed by a large masonry dam, described in Engineering News, of Apr. 9 and May 21, 1911, and will cover 2218 acres of land, submerging the old Kensico Reservoir 110 ft. The old reservoir was built in 1883 by the Department of Water Supply and developed the local drainage of the upper reaches of the Bronx River and its tributaries, including the Rye Ponds, and by a diverting weir and tunnel that portion of the Byram River drainage in New York State.

The most favorable location for the new Kensico Dam was found to be about 400 ft. above the old dam. In order to make this site available, it was necessary to provide a temporary substitute supply. This was done by building two rolled embankment dikes farther up the valley, each about 40 ft. high, one across the Bronx River and the other across the Rye outlet and extending the Bronx pipe line by a 36-in. riveted steel pipe to the Rye dike. The two basins thus formed were connected by a short tunnel and have an available capacity of 5064 million gallons, which is 1800 million gallons larger than the old Kensico Reservoir and more than compensates for the reduced catchment area, which is three miles less than the old reservoir.

This temporary reservoir covers 708 acres, 200 acres of which was swamp land about 28 ft. below the surface of the full reservoir. A large portion of these swamps was of considerable depth. Samples from a depth of 30 ft. showed more than 75% of organic matter. These areas were covered by a rank growth of tussocks and other swamp vegetation. It was feared that these swamps would impart both tastes and odors to the water to an objectionable extent, and as it was essential to use the water as soon as it could be stored, the special treatment of these swamps was considered.

On account of their depth, it was practically out of the question to strip the swamps completely, and to remove only the surface growth would lay bare the underlying muck, which would probably prove more objectionable than the surface growth. It was finally decided that satisfactory results would be obtained if the swamps were cleared and covered with a thin layer of soil, which would act as a blanket to prevent the decomposed organic matter from mingling with the water. Favorable borrow pits were located on the margin of each swamp. The material ranged from a modified glacial drift of fine sand to a more compact soil of finer grain. Steam shovels and an equipment of narrow-gage 18-ton locomotives and 4-cu.yd. side-dump cars were installed by the contractor. The swamps were first cleared by cutting off the surface growth, including tussocks, down to the general swamp level. The tussocks offered considerable resistance, but yielded to sharp grub hoes. The disposal of the tussocks was at first a problem, but it was found that after drying in piles for several months they would readily burn. Fig. 1 shows the character of swamp and swamp growth. Fig. 2 shows a swamp after clearing.

The covering was run out onto the swamp in 10-car trains running on tracks of 60-lb. rails carried on 8-ft. ties laid on the cover. After dumping, it was spread to about 12 in. depth, over the shallower and dryer swamps, while on the deeper swamps it was necessary to increase the depth of cover to about 18 in. This would usually support the load satisfactorily, and it was surprising to see how elastic it was. As the trains passed over it the surface would deflect several inches, forming a wave under the traffic, but as long as the covering did not become saturated by absorbing the swamp water by capillarity, it would satisfactorily sustain the load. A large part of the cover was spread by hand, but later the contractor provided car scrapers which were operated by locomotives. Fig. 3 is a general view of the covering operation. Fig. 4 shows a swamp after the covering was spread.

Aërator on Reservoir Outlet

An aërator of capacity sufficient to pass the whole supply was built on the pipe line (see front-page view). This consists of a circular concrete basin 100 ft. in diameter with a 24-in. delivery pipe laid in a circle of 20-ft. diameter, carrying 44 nozzles. The nozzles are of special design, having interior spiral flanges which impart a decided spiral motion to the jet, causing it to completely break into spray a short distance above the nozzle. This aërator absorbs about 20 ft. effective head.

Frog Guard Rails of Special Design

The guard rails placed opposite frogs in railway track, to hold wheels in position while passing the frog point, are usually pieces of ordinary rail, suitably fastened to the ties and to the running rails. Guard rails consisting of heavy steel angles have been use to a limited extent, and we describe below three other special designs.

Morrison Guard Rail

This is a rolled steel rail of distorted T-section, as shown in Fig. 1. It has a narrow flange on the inner side, and a head of unsymmetrical section, while the web is inclined toward the track rail so as to better resist any thrust coming against it from the back of the wheel. A special tie-plate is used, holding both rails. This has a lug to hold the inner flange of the guard rail and prevent it from tilting under pressure, and has also shoulders to engage the outer flange of track rail and so prevent them from being displaced laterally.

The guard rail has spikes only on the outside, while the track rail has spikes on both sides. There are three holes for the outer spikes, in staggered position, as shown, so that the rail can be shifted inward to maintain the proper width of flangeway when the head is worn. The guard rail and tie-plates are in use on several railways

Fig. 1. Swampy Area of Kensico Reservoir after Having Been Covered with Dirt

from the old Kensico Reservoir, averaged 40% organic matter, and eight samples from the Jerome Park Reservoir, after only 13 months of service storing Croton water, averaged 22.2% organic matter. One of the Central Park reservoirs and the Williamsbridge and Jerome Park reservoirs have concrete floors, the depth of water being 30 ft., 17 ft. and 23 ft., respectively. In these, the depth of silt indicates an accretion of from $\frac{1}{8}$ to $\frac{1}{4}$ in. per year. The microscopic examination of the residue of the samples from these storage reservoirs showed it to consist largely of algae and diatoms with very little vegetable fibre.

In general practice, filtration has for a long time been employed as a means of removing tastes and odors from stored waters and is more or less efficient, depending upon the type of filter used, adequate design and management. More recently, aeration has been employed for this purpose, and with increasing success. The most efficient aeration is that which divides the water into a fine spray under such a head that the individual drops are exposed

with Dirt from Borrow Pits after Removing Growth

FIG. 1. CHARACTER OF SWAMP GROWTH

FIG. 2. AFTER REMOVING GROWTH

SWAMPY BOTTOM OF PORTION OF KENSICO RESERVOIR

Samples were procured from the bottom of the old Kensico Reservoir, built in 1883. This reservoir covered 255 acres to a maximum depth of 15 ft. The area was a rolling open valley of glacial origin with a light soil under farm cultivation. Except for the clearing and burning of the vegetation, no special treatment of the bottom was made. The soil of the adjacent sides contains from 4.7% to 9.9% of organic matter. Samples of the bottom secured at 18 stations in various parts of the reservoir after 24 years' service showed an average of 8.5% organic matter in the original soil, and 12.7% organic matter in the overlying deposit of silt. The depth of the latter varied up to 18 in. and averaged more than 6 in. These results clearly show that in this reservoir the stored water has produced and introduced organic matter which in a comparatively few years has accumulated to an extent to surpass the organic condition of the original bottom soil, and that the beneficial results of stripping would have been only temporary.

To further demonstrate the character of reservoir silt, samples were taken from several of the storage reservoirs of the city which receive water only through aqueducts or pipes from the impounding reservoirs. Twelve samples of the bottom silt from the Croton reservoirs in Central Park averaged 16.5% organic matter, while four samples from the Williamsbridge Reservoir, receiving water

VOLUME [illegible] DECEMBER [illegible] NUMBER [illegible]

The Influence of Reservoir Bottoms on Stored Water

By WILLIAM FREDERICK SMITH*

The nature of artificial reservoir bottoms has a direct influence upon the quality of the stored water. The character of the soil and vegetation of the bottom and adjacent sides of the reservoir, the depth and the presence of shallow-flowage areas, all have important influences upon the tastes and odors of stored waters. The objectionable tastes and odors are produced either by the putrefaction of the organic matter on the bottom as the result of stagnation in deep basins or by the decay of organisms, such as algæ, which grow near the surface of the water. The oxidation of organic matter provides the growing organisms with food, and when present in quantity is an active means of encouraging their growth. Therefore, it would appear that if the organic matter present in vegetation and soil is removed by clearing and stripping the soil, the source of bad tastes and odors would be removed.

At one time it was felt by many engineers and chemists that the best results could be obtained only by a complete stripping of the surface soil [illegible] that the [illegible] exposed surfaces [illegible] have [illegible] percentage of organic matter, and [illegible] amount of money have been expended in removing the surface soils from certain reservoirs with [illegible] good results. Experience has shown, however, that these results are not a permanent prevention of tastes and odors, as there are other sources of organic matter. The incoming water brings with it in suspension organic matter from the surrounding drainage areas, and this, with the remains of the dying surface growths, is continually precipitated to form increasing accumulations on the bottom, which in time will result in a bottom condition that will be the same whether the bottom was stripped or not.

AERATOR ON PIPE LINE FROM TEMPORARY RESERVOIR ABOVE THE NEW KENSICO DAM
(Temporary dike in background)

SAMPLES OF KENSICO, WILLIAMSBRIDGE, JEROME PARK AND CENTRAL PARK RESERVOIR BOTTOMS

That the accumulations on the bottoms of reservoirs may contain more organic matter than the original soil was demonstrated by some investigations made by the Board of Water Supply at the time the question of treatment of the bottoms of the Ashokan and Kensico reservoirs of the Catskill Water Supply System for New York City was under consideration.

*Division Engineer, Kensico Division, Board of Water Supply, City of New York, Valhalla, N. Y.

The size of the deposited sludge particles also plays an important part in this matter. Disintegrated sludge particles, if not too fine, will gasify much quicker than coarse ones. It is important whether feces reach the sedimentation tank well broken up or in large pieces, as it is known that feces retain their floating ability for a long time, apparently because their compact structure offers a considerable resistance to the liberation of the inclosed gases. Finally, the manner in which the sludge particles settle, their sticking together through fat, hairs, etc., have great influence on the formation of sludge cakes, which to a great extent form the sludge cover. The influence of the intensity of the gas formation will be greater the deeper the sludge layer is. With a small free surface, where it can accumulate, the forming scum cover will be thicker. If the surface is too small for the scum, too many gas-laden particles will rise, so that the top layers cannot get rid of their gas quickly enough to sink.

A disadvantage of such a cover is that after it reaches a certain size the rising sludge cakes seek a way out through the open slots to the sedimentation chamber.

Different methods in practice have been tried to destroy and sink the scum covers, such as stirring it with poles or breaking it up with high-pressure water. None of these have been a permanent success, as they do not accomplish the necessary continued mixing of the newly rising sludge. This can only be done by the installation of a mechanical agitator or apparatus, which not only stirs the sludge, but also brings about a thorough mixture of the sludge with the sewage.

The sludge entering the sludge chamber should be well disintegrated. Any scum cover in formation should be broken up by a stream of sewage under high pressure, mechanical agitators, or lowering of the water level in the sedimentation chamber. The plant always ought to be so designed as to have a sufficiently large surface for the escape of the gases.

The appearance of frothing (spitting) in an unripe sludge-digesting chamber is a mere secondary phenomenon. It is similar to the so called "hut" formation in yeast fermentation, and is mostly caused by large amounts of gas rising to a small surface and carrying the sewage and finely divided sludge with it in the form of bubbles.

In ripe sludge-digesting chambers, the scum formation is much lighter and not liable to cause trouble, as the rising sludge is well mixed with sewage and the sludge at the surface loses its gas more readily than fresh sludge, not forming as much gas. But it must be removed from time to time. The spitting and frothing and entrance of sludge into the sedimentation chamber are generally caused by a too heavy floating layer or a too large accumulation of undissolved matter in the sludge-digestion chamber, in which case the gas will carry up froth if the free surface is too small. This can be helped by simply drawing off some of the sludge or permanently prevented by keeping the sludge at a permanent level.

(3) The Different Types of Fresh-Water Clarification Plants with Separate Sludge Digestion

Injurious formation of scum covers, frothing or spitting of the sludge-digesting chamber, acid sludge and, finally, acidulation of the supernatant water are the operating difficulties which are liable to appear in sludge-digesting plants if there is not sufficient room provided to accommodate the floating sludge, a too heavy formation of scum prevented and the sludge withdrawn at the right time.

The sludge-digesting plants under discussion can be divided into two groups. The first group includes those plants in which the sludge-digesting chamber is below the sedimentation chamber, and is connected to it by open slots, through which the sludge drops automatically. Under this head come the Emscher tanks, the Travis tanks, Kremer septic tanks (Kremer-Imhoff tanks), Stiag tanks, Spree tanks, Bus tanks, etc. To the second group belong those in which the sludge-digesting tank is a separate unit and is located beside the sedimentation chamber. The fresh sludge is periodically pumped or drained from the sedimentation tank to the sludge-digesting chamber.

Sludge-Digesting Chamber under Sedimentation Tank

These plants have the great advantage of an automatic sludge separation. But if the sludge is not removed at the right time, rising sludge will enter the sedimentation tank, which is a common occurrence in spite of the overlapping edges of the slots. Difficulty is found in giving the right dimensions to the sludge-digesting chamber in proportion to the sedimentation tank.

All installations coming under this group require expert supervision while ripening. To avoid acid sludge or a heavy sludge cover, which almost always gives an acid reaction, it is recommended to fill the digesting chamber only partly with sludge during the ripening period, and always to keep the sludge at the same level by periodically removing a like amount of sludge. As putrefactive decomposition can only take place while the sludge is alkaline, it has to be kept so at all times—if necessary, by the addition of chemicals. For protection against floating sludge covers, it is to be recommended from a technical point to make the free surface of the sludge-digesting chamber not too small. The partition walls between the sedimentation and digesting chambers should be so arranged that no sludge can collect under them and that the sludge carried up by the gases will be deflected either to the open surface at one side or the gas vents directly over the digestion chamber. The latter should be of sufficient size. Wide longitudinal openings, as are used on the Travis tank, seem to be the best. The long sludge chamber of these and similar plants should be divided into two parts, as in ordinary septic tanks: a larger chamber in which the sludge is digested, and a second smaller chamber in which the sludge particles carried up by the gases are separated. To obtain the largest possible surface and save construction costs, this Institute has sometimes recommended the use of earth ponds with large free surfaces as sludge-digesting chambers.

Separate Sludge-Digesting Chambers Beside the Sedimentation Tank

Under the head of separate sludge chambers, located beside the sedimentation tank, come the designs of Færster, Mondrion, the Neustadter sludge tank, etc. Opposed to the disadvantage of the cost of pumping is the not-to-be-lightly-valued advantage of the complete separation of the sedimentation tank from the sludge tank, so that the latter can never have any detrimental influence on the former. Besides the possibility of unlimited extension, separate sludge tanks have the further advantage that they are very accessible and easily inspected. The decomposi-

tion of the sludge can be [illegible] in all its stages and can be [illegible] as necessary or desirable. With high ground water, the first cost of the shallow tanks will be considerably less.

Separate sludge-digesting tanks can be built as single units which are intermittently filled (Foerster), or as a group of tanks which make a continual operation possible (the Neustadter tanks). A good sludge digestion is obtained by both types. The single units require individual expert operation, but the continual (daily) operation of tanks in series can be made almost entirely automatic. The first mentioned construction can be easily arranged so that the tanks can be operated either as units or in series. In arranging the tanks in series, the different processes can be separated. The fresh decomposition of the sludge and sewage will take place in the first tank, and in the last tank the sludge can be "washed" by the introduction of clean water before it is drawn off. The advantage of washing the sludge in no way interferes with the addition of the sewage, necessary for a brisk decomposition. Sewage should always be introduced into the first tank, if not enough is contained in the withdrawn fresh sludge. The following arrangement can be recommended: The clean water should be introduced into the tank that contains the best digested sludge, then passed from there to the tank that contains the second best sludge, etc., until it is let off, so that the sludge in a certain stage of digestion never comes into contact with sewage from a sludge in a less advanced state of decomposition. The capacity of such tanks ought to be about the same as those that proved sufficient for Emscher tanks.

Result

Fresh-water clarification plants, with a separate sludge digestion, considered as a whole, are a distinct advance in the field of sewage and sludge treatment. They simplify the mechanical clarification of the sewage, lessen the sludge nuisance and have advanced the solution of the sludge question.

The obtaining of a good sludge did not prove to be such a simple matter as was originally supposed. Communities which have their plants built by contractors will do well not to accept the plants until the sludge-digestion chamber delivers a good sludge. Very careful preliminary investigation should be made in each case to find out whether such a process is suitable to local conditions. Due consideration should be given to the difference of construction and operation. Other points to which attention should be paid are: Whether the sludge-digesting chamber should be located below or beside the sedimentation tank, or whether both types should be used; also whether it would be best to [illegible] an [illegible] of one or only tanks [illegible] for a future installation.

With proper design and expert supervision, it is possible to avoid the above [illegible] operating troubles, which often make an otherwise good plant troublesome. It will be absolutely necessary to stop the now prevalent custom of [illegible] all plants after one pattern. Also when considering the efficiency of a plant, a sharp line should be drawn between the two functions, sedimentation and sludge digestion.

Good Roads Construction in Colorado [illegible]

Repairing and Resurfacing Bituminous Pavements

By Samuel H. Lea*

A cheap but effective method of renewing the surface of old bituminous pavements was employed by the writer recently on some streets in Charlotte, N. C. In this city there is a considerable area of "bitulithic" pavement, laid in 1907-'08 under a 5-year guaranty by the contractor. Since the expiration of the guaranty period it has become necessary for the city to maintain this pavement.

Failure of Macadam Foundations—The area under consideration comprises some of the principal business streets in the heart of the city, where traffic is quite heavy. These streets were originally macadamized and, since the old macadam had been in place for many years, it was thought to be suitable for a base for the "bitulithic" pavement, which, accordingly, was laid directly upon it. This method of construction has not proved satisfactory, especially for streets with heavy traffic, and it has been discontinued. The city's specifications now require all pavement to be laid on a concrete base.

Repair Work

Soon after the expiration of the contractor's guaranty the pavement began to show signs of wear and, in many places, small holes appeared; these quickly enlarged by raveling, becoming in some cases sufficiently large to cause serious inconvenience to traffic.

Patching—The first repair work undertaken by the city was in January, 1911; this consisted in cutting out the raveled places and patching the holes with new material. The work was done by a contractor who was then engaged in paving other streets in the city with sheet asphalt, which material was used for making the patches in the "bitulithic" pavement. The patches thus made were strong and durable, joining up smoothly with the adjacent surfaces. The appearance of the finished work, however, is not uniform; the patches are rather conspicuous, especially after rains.

The work was confined to the repair of worn places and depressions in the pavement and no attempt was made to treat the adjacent surface of old pavement. In making the patches the edges of cuts were trimmed smooth and vertical and all loose material was removed from the holes, care being taken to cut into the old macadam foundation as little as possible. The edges and bottom of the cut were then painted with hot liquid asphalt, and the hole was filled with asphalt paving mixture heated to a temperature of about [illegible]° F. The edges of the patch were then smoothed with a hot iron, tamped by hand, and the patch compacted with a steam roller. The appearance of typical cuts, ready for filling, is shown in Fig. 1. The loose stones in the bottom are part of the old macadam base; this was carefully tamped by hand before the cut was filled with new material.

Cost Data—Since the repairs were made in the form of isolated patches, scattered over a wide area, no satisfactory unit price for the completed work could be agreed upon in advance, and it was decided to have the contractor perform the work at actual cost for labor and material plus [illegible]% for use of tools and plant. The city provided an inspector who accompanied the repair gang from

*City Engineer, Charlotte, N. C.

place to place and supervised the work. After the completion of repairs the total cost was determined, also the extent of work. From these data the following statement has been compiled:

Total area of patches made: 308.6 sq.yd.

Material and labor	$609.75
Cost of inspection	32.00
Total cost of repairs	$641.75

Unit cost of work: $2.08 per sq.yd.

Repairs with Asphalt "Pancakes"—The foregoing repair work was completed in the latter part of January, and it was then thought that additional repairs to the pavement would not be necessary for a considerable while, since there were at that time no further signs of raveling. This condition did not continue long, however, for within a few weeks new holes began to appear and the surface of the pavement continued to deteriorate, assuming a deeply pitted appearance over practically the entire area. On College St., where the traffic is heavy trucking for wholesale houses, the pavement soon raveled badly and was worn into holes in many places. This condition is shown in Fig. 2, which is from a photograph of a portion of College St., taken in May, 1914.

Fig. 1. Cuts in 7-Year Old "Bitulithic" Pavement on Old Macadam Foundation; Ready for Filling with Asphalt Mixture

Fig. 2. North College St., Showing Condition of a 7-Year Old "Bitulithic" Pavement on Old Macadam Foundation; before Patching

In June, it was decided to make the additional repairs that were then necessary, and a repair gang was organized from the city street department. This gang included a foreman, four laborers, a driver with a one-horse wagon. The patching material was obtained from "pancakes" or slabs of ready-mixed sheet asphalt, which had been made up for this purpose during former paving operations in the city.* These "pancakes" had been stored under cover and were in good condition for use upon being heated to the proper temperature. The city's 10-ton steam roller was used for compacting the patches after the cuts were filled and the edges had been tamped down by hand and bonded to the adjacent pavement with a hot smoothing tool. It was found that the three-wheel roller, used under these conditions, did very good work, making a smooth and compact surface.

Cost Data—The total area patched in June was 422.14 sq.yd. as compared with 308.6 sq.yd. in the first work described. The regular tools and equipment of the city street department were used as far as practicable, and such additional equipment as was purchased for the work was charged to cost of work. The steam roller was charged at the rate of $10 per day for machine and roller man. The ready-mixed asphaltic paving material used was estimated as being worth 40c. per sq.yd. in finished patches. The following statement covers the cost of the work:

Total area of cuts filled: 422.14 sq.yd.

Labor and tools	$294.18
Patching material	168.86
Total	$463.04

Unit cost for area repaired: $1.10 per sq.yd.

Surface Treatment

Soon after the completion of repair work in June it was decided to apply a flush coat of cold refined tar to the entire pavements under discussion. The object was to fill up the small pits and depressions in the surface of the old pavement and also to renew or replace, as far as practicable, the cementing material or bitumen that had escaped from the body of the old pavement; and to prevent, for a while at least, further raveling or disintegration of the pavement.

Materials and Methods of Work—The pavement was first gone over with the city street-sweeping machines; usually on the night before repair work was commenced. Later, a suitable area was roped off from traffic and the surface was swept by hand immediately before applying the refined tar. The working force comprised a foreman, six laborers and a driver with a one-horse wagon. Sand was delivered at convenient places by contractors at a fixed unit price. The wagon was used to haul and distribute the other materials as needed. The refined tar was brought to the job in barrels; from these it was pumped into buckets and spread by hand over the pavement.

The tar was then swept along by laborers, using wire push brooms, and distributed so that every portion of the pavement surface was covered. The tar was sufficiently thin to penetrate readily into the pavement. A sufficient quantity of the tar was poured over the surface to allow the pavement to absorb it to saturation; the surplus tar found its way to the gutters, from whence it was later taken up for further use. The tar was forced into the pavement by the sweepers as much as possible, the object being to make it serve both as a filler and a seal coat for the pavement.

*A more detailed account of this method of making repairs will appear in a subsequent issue

After application, the treated surface was allowed to remain uncovered for from one to three hours; it was then covered with coarse sand to a depth of about $\frac{1}{4}$ in. The street was then opened to traffic.

COST DATA—A careful account was kept of every item of expense entering into the work; from this the following statement of cost has been compiled:

Total area of pavement covered by surface treatment [illegible] sq.yd.	
[illegible]	$[illegible]
[illegible]	[illegible]
Trucks [illegible]	[illegible]
[illegible] of refined tar at [illegible]	[illegible]
Total	$[illegible]

Unit cost of work [illegible] per sq.yd.

CONCLUSIONS

A comparison of unit costs for the two jobs of patching shows a much lower rate for the work done by the street department, using ready-mixed paving material. As a result of the experience herein described, it is probable that the city will adopt this method for future repair work. If bituminous paving material, prepared for use, can be obtained at a reasonable price, there is no necessity for a city to purchase and maintain an expensive asphalt plant for ordinary repair work; in such cases repairs can be cheaply and effectively made with a comparatively small outfit.

The surface treatment of the old pavement after the completion of repairs was in the nature of an experiment, it being the first work of the kind attempted in this city. Considering the low unit cost of the work, less than [illegible] per sq.yd. of pavement covered, the results obtained are quite satisfactory.

In addition to the operation of flush coating, and while this was in progress, some shallow patches were made without cutting the old pavement. This was done by filling the depressions with finely crushed stone coated with the surfacing material and tamped with hand tampers until the patch was thoroughly compacted and bonded to the old pavement.

Experience has shown that more sand was used in the work than was necessary for the best results. The sand, after being spread, was allowed to remain in place for a week or more, and while a considerable portion was taken up by the tar, much of it was washed by rains into the gutters, from whence it was later removed by the street-cleaning department. About one-half the quantity of sand used would have been sufficient for the purpose.

The bituminous coating went much further and covered more area than was expected. One gallon of the refined tar covered a fraction over [illegible] sq.yd. even after being allowed to soak freely into the old pavement. The penetration was good as was shown by cutting into the pavement in several places after the tar application. It was found that the tar had in most cases penetrated as far as [illegible] below the surface.

A noticeable feature was the springy, elastic nature of the surface of the old pavement after treatment. This was a matter of general comment by citizens, many of whom had been skeptical about the work in the early stages. The seeding of the pavement was arrested by the [illegible] by the treatment; it is not expected, however, that [illegible] will be prevented for any great length of time. Such a consummation would be too much to expect from a superficial application of a cold bituminous material.

On the whole, the results obtained from this experimental work are considered quite satisfactory, and it is thought that the work done has been efficient and economical and well worth the cost.

A Snow-Removal Plan for New York City*

In past years the city depended upon trucks alone to haul snow from streets to waterfront dumps, the work starting as a rule after the storm was over and traffic retarded or completely blocked. No other method was considered available, and the speed of clearing snow from streets thus depended upon the supply of trucks for snow work. The maximum number of vehicles which could be procured last winter was 3000, and each truck averaged 50 cu.yd. per day. Under these conditions 150,000 cu.yd. of snow was the maximum amount per day that could be removed from roadways. With the [illegible] snowfall in February and March of this year, it required over [illegible] days to clear snow from the 1911 scheduled area of 20,000,000 sq.yd.

The only additional method of accelerating the removal of snow, up to last winter, was by decreasing the length of haul for trucks through the use of main trunk sewers for snow disposal, and only a limited number of such sewers was allowed in the Borough of Manhattan.

As a result of last winter's experience and tests it appears that the city has had available for years past a possible solution of the problem of rapid snow removal through the extensive use of sewers, not alone after a snowfall, but during the progress of the storm. It was also learned that snow work should be started with the storm, *clean* snow dumped into sewers as it falls, and the attempt made to keep pace with the storm, instead of trying to dig the city out after the block has occurred.

It should be recognized that these discoveries regarding snow work need be tested by a winter's experience, but whatever is done next winter in the disposal of snow through sewers must be [illegible] as a decided addition to past methods, which likewise will be continued in operation.

THE 1914-1915 SNOW FIGHTING CAMPAIGN

Based upon the data concerning sewers, it is planned to utilize all sewers having a sufficient flow of water to transport snow and by means of regular sweepers acting as squad foremen, to assign emergency laborers in sufficient number to place in manholes snow falling at the rate of $1\frac{1}{2}$ in. per hr. The number of emergency men required for this purpose will approximate [illegible] per shift of eight hours.

In addition to pushing snow into sewer manholes in adjacent streets where sewers are available for snow disposal, the snow-fighting force will remove snow from intersections of [illegible] streets, placing it in sewers where such can be used, or else piling it. It is also part of the plan to assign the snow-fighting force to clean the roadways at [illegible] crosswalks.

Last year's experience in disposing of [illegible] cu.yd.

*From a report by J. T. Fetherston, Commissioner of Street Cleaning, New York City, to the Board of Estimate and Apportionment on "Snow Work" [illegible] of [illegible]. The report was dated [illegible] 1914. It was submitted in part for the purpose of securing the approval by the board of certain [illegible] of the plan. [illegible] from the [illegible] in our issue of [illegible] 1914, p. [illegible].

of snow in large sewers demonstrated the economy of this method, the cost being approximately 15c. per cu.yd. Special tests in the various boroughs, together with scientific observations conducted by the Sewer Bureau of the Borough of Manhattan,* verified the general conclusion that all sewers having a sufficient flow of water can be utilized for the disposal of *clean* snow without injury to the sewers. On streets where sewers are unable to carry off the snow, the roadway will be cleared and the snow piled for removal by carts or trucks.

For the purpose of showing the advantage of snow-fighting work over contract removal, a tentative estimate of the time required to clear the scheduled area in the three boroughs and the cost thereof is presented herewith.

Assume snow falling at the rate of ½ in. per hr., the storm continuing for 14 hours:

Item	Snow Fighting Force	Contract Work
Estimated time required to complete work after storm ceases	4 hours	168 hours
Estimated cost per million square yards cleared	$5,460	$22,438
Estimated total cost of clearing scheduled area	109,200	448,760

This estimate, as well as all plans for snow fighting, is based on the following assumptions:

(1) That a sufficient force of emergency labor can be started at work, day or night, within four hours after a continuing snowfall begins.

(2) That a rate of pay sufficient to attract labor and make the men anxious to work can be offered by the city.

(3) That the weather conditions will not be so extreme as to prevent men from working during the storm.

(4) That a sufficient amount of normal sewage is flowing in the bulk of the sewers to transport snow to the rivers and harbor.

(5) That the ordinary flow of sewage can be supplemented by water from hydrants where the normal flow is insufficient to transport the snow.

As the snow-fighting method involves a new departure in snow removal, every effort has been made to plan the work so as to meet anticipated conditions. This has involved a tremendous amount of detail study and observation of factors heretofore unknown.

To meet the various requirements of the snow-fighting problem, the following work has been completed.

1. Survey of Sewers—The depth of sewage and quantity of sediment in 50,000 sewer manholes and the velocity of sewage in 1098 miles of sewers, in the boroughs of Manhattan, the Bronx and Brooklyn, have been determined and the information plotted on maps.

2. Weather Conditions—Meteorological information regarding the duration, rate and fall, and depth of snowstorms has been studied and all published figures concerning snowfalls and their prediction by observation of the barometer, wet- and dry-bulb thermometer, direction and force of wind, cloud formation, etc., are available and will be used in conjunction with the weather reports from the United States Weather Bureau.

3. Labor Conditions—A general examination has been made of the available supply of labor and plans for quickly filling the quota required on snow fighting have been prepared. Registration of snow fighters at the various section houses and stables will be started about Nov. 15, 1914. All printing and forms for this purpose have been ordered.

4. Assignments—After the registration begins, notification cards will be sent to all men on the list, giving their assignments and information as to time for reporting and location of stations. Each individual or gang will have a set task to accomplish within a specified time.

5. "The Call to Work"—Should a snowstorm start during the day, the street-cleaning force will be available, and emergency laborers with notification cards will have instructions to report without special notice. If, however, a storm starts during the night, it will be necessary to call all men. It is proposed that the police shall coöperate with this Department, so that when notice is given by the Commissioner to Police Headquarters, all patrolmen will be reached by telephone as soon as possible and will call out the regular employees of the Department, as well as the emergency men. A list of all employees and registered laborers will be furnished for each patrolman's beat in the three boroughs, and in this way it should be possible to get a large number of men into service on short notice. In addition to the notification by the Police Force, the night workers in each Department stable will be utilized for calling men to work.

6. Equipment—The principal tool used on snow fighting will be the sweeper's pan scraper, supplemented by road scrapers, scoops, plows, picks, etc., all standard Department equipment. It is likewise proposed to increase the snow-carrying capacity of sewers by using bags as temporary dams where necessary to increase the depth of water in the manholes.

7. Unscheduled Streets—On streets where removal is not deemed essential, snow plows attached to automobiles and horse-drawn plows will be used for opening roadways for traffic. Street intersections with near-side cars will be cleared while the storm is in progress.

Organization and Management of the Snow-Fighting Force

Organization—Three divisions will be organized for snow fighting: (1) The first line of attack will comprise regular Department employees, supplemented by emergency laborers. The unit of organization will be based upon the sweeper as leader of a squad of emergency laborers, working under the direction of regular department officers.

(2) The first reserve will consist of regular drivers with horses and carts, drafted for a night shift, to clear streets where the snow-fighting force cannot use the sewers.

(3) The second reserve will consist of private trucks for day and night service, used as a supplementary force when the two regular forces have been unable to cope with the storm. This reserve force will be covered by the registration of private vehicles and assigned as may be necessary according to the requirements of the situation.

Management—Definite printed instructions have been drafted to cover all phases of the work, and classes have been started for the officers of the Department. Drills of regular employees will be held after Nov. 15, and night or day calls will be tried to prove their effectiveness.

*See article in "Engineering News," Oct. 29, 1914.—Editor.

Hell Gate Arch Bridge Not a New Thing—The following is a curious allusion to the 977½-ft. steel arch which the New York Connecting R.R. is now building across Hell Gate, East River, New York:

> Never perhaps since our first Bridge-Builders, Sin and Death, built that stupendous Arch from Hell-gate to the Earth, did any Pontifex, or Pontiff, undertake such a task.

It is taken from Carlyle's "Sartor Resartus," Book I, Chapter XI. The "pontifex" of the present Hell Gate arch is Gustav Lindenthal.

Field and Office

Portable Hoist Towers for Concreting*

Portable hoist towers for conveying and placing concrete are gaining in favor with contractors. Very often it is cheaper to employ a movable tower than to erect a high stationary structure.

An interesting application of this method on retaining-wall construction is described below. A second case is given where the mixer and the tower are both portable, mounted on standard flat-cars, and moved about a large area, with excellent results.

Stationary Mixer and Moving Hoist Tower

A hoist tower mounted on trucks is used to convey concrete from mixer to construction in the four-tracking work of the New York Central & Hudson River R.R., now under way at Poughkeepsie, N. Y. This work includes the building of several retaining walls, one of which is shown in the making, with the portable tower at work, in the accompanying views, Figs. 1 and 2.

The wall is of the standard gravity type. It is about 28 ft. high at the northern end, 10 ft. wide at the base, and 21 in. at the top with a 2-ft. coping. The lower end is 6 ft. high, with other dimensions corresponding.

In building the lower portion of the wall wheelbarrows were used instead of the tower. By this method 20 men placed 40 cu.yd. of concrete per day. After 15 days a movable hoist tower was brought on the job from a wall near-by which had been built with the tower, and the 20 men then handled 125 cu.yd. daily.

This portable hoist tower is mounted on four wheels, which run along at the base of the wall on a standard-gage track. The tower is 34 ft. high and is equipped with a ½-cu.yd. bucket which can be tipped at any elevation desired. The general layout of the work is shown in Fig. 2.

Fig. 3 shows the rigging of the tower. A cable runs from a drum of the two-drum hoisting engine to a pulley on the car, thence over two pulleys at the top of the structure, down to a pulley on the bucket and up to a fixed point on the top of the tower. The car is moved forward by means of a cable from the second drum to a deadman at the farther end of the track and back to the front of the car, as shown in the diagram. To return the tower to the mixer, the bucket is blocked and the hoisting drum of the engine operated.

A depression in the track at the mixer allows the bucket to be lowered below the level of the chute from the

*The following articles on hoist towers have appeared in "Engineering News" of recent date: "Steel Concreting Tower Designed for Rapid Erection," Sept. 24, 1914, p. [illegible]; "Movable Concreting Plant with Telescopic Tower," Nov. 12, p. [illegible]; "A Stationary Telescopic Hoist Tower," Nov. 19, p. [illegible].

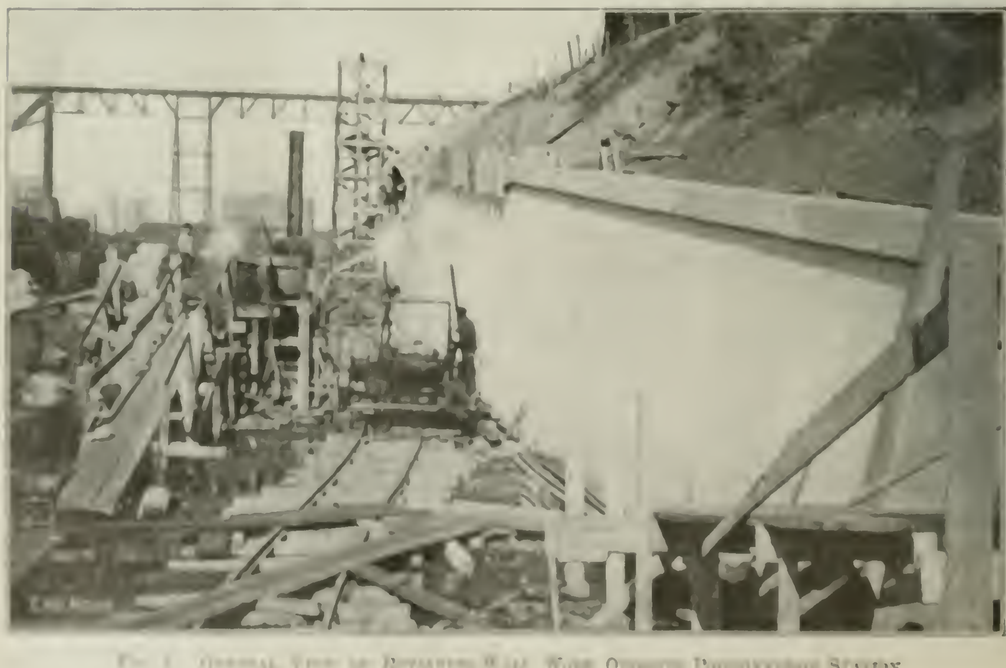

Fig. 1. General View of Retaining-Wall Work Opposite Poughkeepsie Station

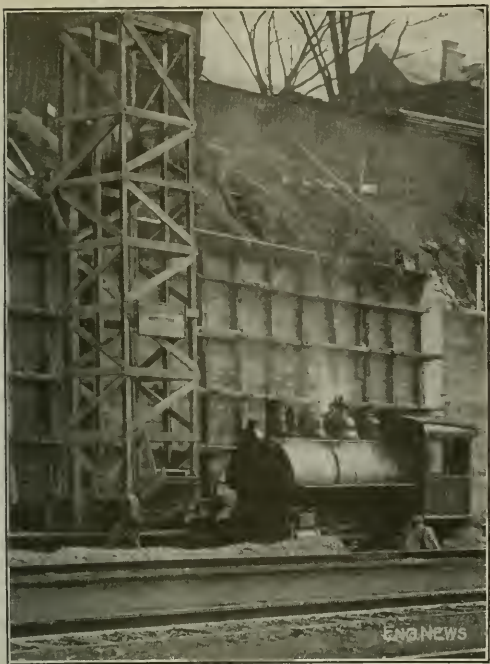

FIG. 2. PORTABLE TOWER AT POUGHKEEPSIE, BUCKET IN DUMPING POSITION

mixer, so that the concrete may be discharged into the bucket by gravity.

The work is being done for the New York Central & Hudson River R.R., under the direction of G. W. Kittredge, Chief Engineer; J. W. Pfau, Engineer of Construction; R. E. Dougherty, District Engineer, Eastern District, by Richard & Gaston, contractors, New York City (W. McKee, Superintendent on the job).

FIG. 3. RIGGING OF POUGHKEEPSIE CONCRETING TOWER

MIXER AND HOIST TOWER ON FLAT-CARS

At the Jersey City terminal of the Central R.R. of New Jersey, a portable mixing and distributing plant was desirable on account of the large area over which the work was distributed, the small amount of concrete placed in any one location and the difficult conditions imposed by sustained traffic. The work of handling materials, mixing and hoisting to roof were all done on two existing standard-gage tracks, 13 ft. c. to c., immediately adjacent to the work. The concreting materials were brought in on cars directly to the ¾-cu.yd. mixer mounted on a standard 40-ft. flat-car and which was fitted with permanent runs, water-tight cement bins, and water connections.

After mixing, the concrete was dumped directly into the hoist bucket which was permanently located with tower and hoisting engine on a standard 50-ft. flat-car, with permanent sway braces, guides, etc. The tower was 82 ft. high, and near the top was equipped with an ordinary receiving hopper, which discharged into three Insley steel chutes, 30, 20 and 15 ft. long.

The chutes were supported at their hopper joints by rigging hung from two booms, 30 ft. and 32 ft. in length, respectively, which were attached to the side of the tower, well up toward the top. The whole rigging was supported from the tower, with the exception of the discharging end, which was moved from place to place by two men. The booms were free to swing in any direction, and the plant discharged over a semicircular area having a radius of about 50 ft.

FIG. 4. CONCRETING TRAINSHED, JERSEY CENTRAL TERMINAL, WITH HOIST TOWER ON FLAT CAR

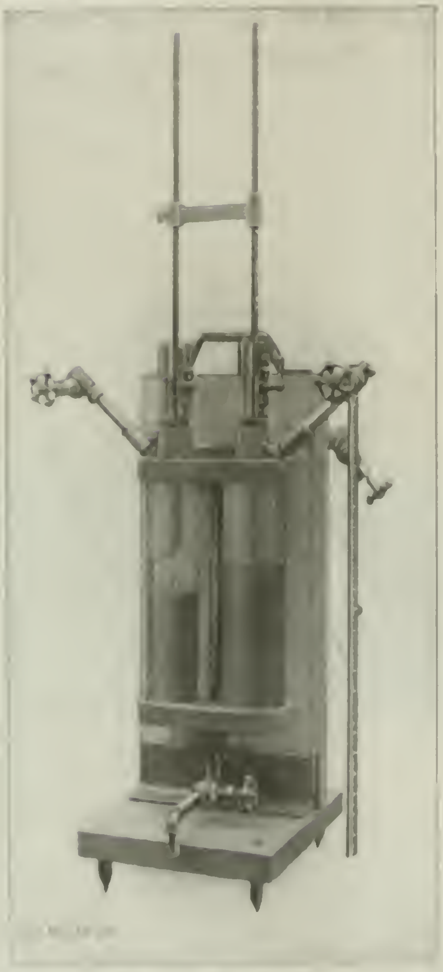
This mobile mixing plant allowed the concreting to proceed very rapidly; in fact, practically as a continuous operation. The plant was often moved 100 ft. or more during the noon half-hour. With this plant from 60 to 90 cu.yd. of concrete were placed in 3½-in. roof slabs, which were cut up with numerous skylight curbs, smoke ducts, etc., by about 30 men in an 8-hr. shift.

The work was done by R. P. and J. H. Staats, New York, under the direction of Joseph O. Osgood, Chief Engineer of the New Jersey Central; A. E. Owen, Principal Assistant Engineer. C. M. Titsworth was Assistant Engineer in Charge of Construction, for the railroad.

A Differential Gage for Very Small Pressure Differences

By William Easby, Jr.*

A novel form of differential gage, capable of accurately measuring very small differences of pressure, is shown in the accompanying illustration. It differs in two respects from the usual forms in which a gage liquid heavier than water is used. First, the tubes are so large in diameter that the troublesome irregularity of the meniscus so common in the small sizes of tube is confined entirely to



Differential Pressure Gage for Measuring Small Pressure Differences

the edge, leaving a large plane surface unaffected by capillarity. The second point of difference is in the use of special hook-gages to measure the deflection. The hook end was originally provided with the customary sharp point but it now finished in a small [illegible] (more easily seen) which can be accurately set in the surface of the meniscus by bringing it tangent to its reflection. These hook-gages have a common vernier reading to 0.001 ft., attached by an arm to one of them and surrounding the graduated rod of the other. To set the vernier, the tubes are subjected to the same pressure. The ends of the hooks are then brought tangent to the menisceses and the arm is moved until the zeros of the scale and of the vernier coincide. Colored carbon tetrachloride, to which benzine has been added to obtain the desired density, is used for the gage liquid.

It is essential for accuracy, particularly when the deflections are but a few thousandths, to rid the gage and connections of all air, which is most easily accomplished if they are placed lower than the source of pressure. Caution should also be used respecting the effect of heat. It was found that a lighted incandescent lamp held for a few minutes close to one side of the gage caused sufficient expansion of the carbon tetrachloride in the tube on that side to render observations almost worthless.

This instrument has been used successfully in the hydraulic laboratory of the Civil Engineering Department of the University of Pennsylvania, to investigate the distribution of velocities of approach in weir tanks, to study the critical velocities in pipes and for other experimental work. It can be adapted to a considerable range of pressure by varying the density of the gage liquid, but it is of greatest service in measuring very small differences of pressure.

*Instructor in Hydraulic Engineering, University of Pennsylvania, Philadelphia.

Irrigation Flumes of Ingot Iron

Flumes made of ingot iron are being used on a number of irrigation projects in the Western states. The Cascade Irrigation District, Ellensburg, Wash., will have 15,000 lin.ft. of metal flume, which is said to be the longest large flume of this kind in the United States. 7000 ft. of this were installed in 1913 and 8000 ft. (cf. No. 26

Irrigation Flumes Built of Ingot Iron Plates

gage) in 1914. This district will have also four concrete-lined tunnels aggregating $1\frac{1}{4}$ miles, $\frac{3}{4}$ mile of concrete-lined canal, and 30 miles of earth canal. This district has an area of 13,000 acres, to be supplied with water from the Yakima River, and the work is provided for by a bond issue of $700,000. R. W. Rea is chief engineer; D. C. Henny, U. S. Reclamation Service, is consulting engineer.

The Tumalo Irrigation District, of Laidlaw, Ore., has an area of 22,000 acres under irrigation from the Deschutes River, and about 9000 ft. of metal flume have been installed. About $450,000 of state funds have been expended on this project during the past two years. O. Laurgaard is project engineer.

The metal flumes on the above works are of the Lennon type, made with semicircular sheets of the Armco ingot iron, and supplied by the Coast Culvert & Flume Co., of Portland, Ore., to which we are indebted for photographs and information. In the accompanying cut the upper view shows a long stretch of hillside flume. The portion built against the bluff has an inclined roof to throw off any débris falling upon it. This roof is shown more distinctly in the lower left-hand view. The lower right-hand view shows the connection of a concrete feed canal with an iron flume.

High-Head Centrifugal Pumps may be installed shortly in the Aspinwall pumping station of the Pittsburgh (Penn.) water-works. This station is one of two handling the filtered water from the city's filtration plant at Aspinwall, 5 mi. above the city. It pumps against 280 ft. head into the new Cabbage Hill reservoir, North Side, but will later handle part of the pumpage into the Highland reservoirs, the upper one of which gives a head of 375 ft. now handled by the Brilliant pumping station, on the opposite bank of the Allegheny. A two-stage centrifugal pump driven by a steam turbine is contemplated.

Outline of Data to Be Obtained for a Report on the Feasibility of Any Irrigation Project

By H. F. Robinson*

In preparing data for a report or in the consideration of a proposed irrigation project, either nonstorage or storage, even the most experienced engineer often inadvertently omits the discussion of some item that has a vital bearing on the success or failure of the project, or fails to look up in the field something that necessitates another trip or the omission of important matter. It was to put into suggestive form, especially for the engineer in the field, the principal things to be observed and investigated, and as a list of topics that might be followed in making up the report, that the following outline was arranged. Since it was first compiled, ten years or more ago, it has been tried out in the field and amended from time to time, as experience directed, until it is thought that most topics that may be needed have been included.

Copies of the list or outline have been made and supplied to the engineers of the U. S. Indian Irrigation Service and others, and it has proven of value in their work. It is now offered to other engineers in the hope that it may assist them in similar work:

*Superintendent of Irrigation, in charge of all irrigation work for the Indian Service in Northern Arizona, New Mexico and Colorado; Albuquerque, N. M.

Outline of Required Data

NONSTORAGE SYSTEM

Physical features in general.
Altitude and climatic conditions.
Area that may be irrigated.
Nature of the land.
  Rough or smooth.
  Cost of clearing.
  Cost of leveling.
  Natural growths.
  Value of natural growths.
Ownership of land.
Source of water-supply.
  Quantity of water available.
  Flow of stream by gaging.
  Records of flow.
  Rainfall.
  Drainage area, its character and probable runoff.
  Prior rights involved.
  Is water adjudicated?
Quantity of water for this project.
Local laws and litigation.
Duty of water.
  Nature of crops.
  Length of irrigation season.
  Soil.
  Alkali.
  Seepage and evaporation.
  Amount of water needed for the land, or how much land may be covered with the water available.
  Methods of using water.
  Crop requirements.
  Rotation.
  Proposed methods of distribution.
Diversion works.
  Physical conditions at the proposed heads.
Dam.
  Kind.
  Cost of materials.
  Where obtained.
  Nearness and kind of rock.
  Other material that may be used, as timber for cribs, lumber that may be cut, sand, gravel, etc.
Carriers of freight.
  Distance from railroad.
  Cost of freighting.
Roads.
  Existing, required and changes necessary.
Headgates, waste gates, etc.
  Size and kind.
  Gate lifts.
Canal.
  Size, length, slopes, grades.
  Nature of material excavated.
  How excavated; teams, dredge or other methods.
  Labor; kind, availability, cost.
  Special or unusual structures.
  Automatic spillways, flumes, culverts, sand traps, bridges, etc.
  Laterals and structures.
Silt.
  At normal flow.
  During floods.
  Nature of.
  Drifting sand in water.
Possibility of increasing water-supply.
  Return water from seepage.
  Reservoirs.
  Pumping underground water.
  Cost of fuel.
  Depth to ground water.
  Other data relative to pumping.
Possibility of water power.
  Its value and market.
Products.
  Kind and market.
Condemnation and damages.
Rights-of-way.
Total cost of project.
  Cost per acre of ground covered.
Basis of return on investment.
Method and period of repayment.
Sinking fund. Interest.
Maintenance.
Very brief comparison with other similar projects.

STORAGE SYSTEM

Physical features in general.
Altitude and climatic conditions.
Drainage area.
Streams and tributaries.
Flow by gaging.
Records of flow.
Rainfall.
Probable runoff of drainage area.
Vegetation in storage basin.
Timber and fuel adjacent to basin.
Prior rights to any of the flow.
Water adjudicated or not?
Amount for storage.
Silt and sediment.
Alkali and salt.
Reservoirs.
  (A failure of any of the seven following requirements ruins the project.)
  1—Sufficient supply.
  2—Good basin.
  3—Good dam site.
  4—Good material.
  5—Good foundation.
  6—Sufficient good land.
  7—Sound commercial basis.
Dam.
  Kind proposed.
  Nature and cost of material.
  Where obtained.
  Carrier and freight.
  Nearness of rock supply, nature and quality.
  Sand and gravel.
  Other building material.
Temporary diversion of stream.
Permanent outlet of reservoir.
Spillway.
Amount of storage at varying dam heights.
Physical and chemical tests in general.
Power canals.
  Horsepower available.
  Power plants.
  Transmission.
  Use to be made of power.
  Value of developed power.
Maintenance.
Roads
  Existing, now required, changes.
Underground water-supply in irrigated district.
  Analyses of underground water.
  Depth to water table.
  Probable quantity for pumping.
  Pumps and pumping.
Cost.
  Present and probable future cost.
Existing appropriations of water and rights.
Existing and proposed methods of distribution.
  (Cf. memo. under nonstorage supply.)
Local laws and litigation.
  Water rights.
    Existing and proposed.
    Attached to land?
Methods of using water.
  Duty of water in locality.
  Length of irrigation season.
  Crop requirements.
  Rotation.
  Seepage and evaporation.
  Losses in distribution.
  Return flow from irrigated areas.
  Depth to water table.
Soils.
Products.
  Markets.
Rights-of-way.
  Condemnation and damage.
Total costs.
  Cost per acre-foot of water stored.
  Cost per acre-foot of water supplied.
Cost of pumping.
  Area of land supplied.
  Cost per acre watered.
  Cost per acre-foot per foot of lift.
Basis of returns on investment.
Methods and periods of repayment.
Sinking fund. Interest.
Maintenance.
Relations of the users of water to the government, including contract for water (in case the project is a government project).
Very brief comparison with other similar projects.

Small Caterpillar Tractors for Miscellaneous Hauling

The accompanying illustrations show a type of gasoline tractor which is gaining favor in the Far West for a variety of hauling purposes. While not very rapid (about 3 mi. per hr.), these tractors are efficient and economical for hauling over roads and across country where no other kind of motive power, except perhaps several teams of

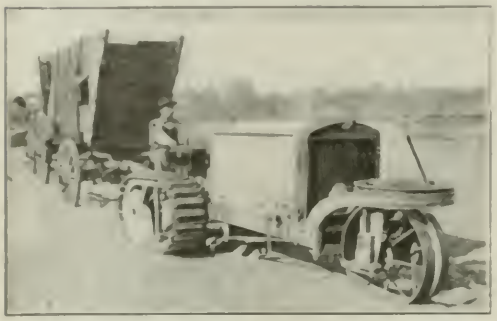


FIG. 1. SMALL CATERPILLAR GASOLINE-ENGINE DRIVEN TRACTOR USED IN THE WEST

oxen, could make any headway. They are used for drawing cultivators and other agricultural implements, for lumbering, freighting, and have proved of special value in engineering construction work.

For road building they are used to haul scarifiers, plows, scrapers, and grading machines, as well as material wagons. As stationary power plants they can be used for pumping, running concrete mixers, etc. For irrigation, ditching and levee building their ability to get over rough ground and soft, like new embankments, is a great advantage. They will climb up a levee slope or ride down into an irrigation ditch without the least difficulty. The front wheel operates on the same principle as the ball-bearing caster of a piece of furniture, and will turn the tractor around almost within its own length.

FIG. 2. CATERPILLAR TRACTOR HAULING A LOAD OF 7 TONS OF DREDGE BUCKETS UP A [illegible] GRADE

To protect the engine from shocks the [illegible] in the hubs of the [illegible] wheels, [illegible] against a powerful spring, which carries the weight of the forward end, and the track frames are supported [illegible] by heavy compression springs [illegible] to the main frame. The [illegible] of the tractor [illegible] is a ball-bearing tread. All the weight borne by the treads is carried on a double row of large balls of chilled cast iron between each tread and its frame. The track links are of manganese steel. Two sizes of these tractors are made with pulls of 12 and 18 hp., respectively, and of 20 and 25 hp. as stationary power units. These tractors are made by Yuba Construction Co., of Marysville, Calif.

Some of the History of Steel Tapes

A correspondent has asked, "When were steel tapes introduced into surveying work?" This question is not so easily answered as it looks. Letters addressed to the leading instrument manufacturers brought indefinite replies in all except two or three instances.

Theodore Hase, Vice-President and Treasurer of the Lufkin Rule Co., wrote:

We have no definite or authentic information on this subject, except that the first steel tapes were made in England and the first ones in the United States by the George M. Eddy Co., Brooklyn, N. Y.

The George M. Eddy Co. informs us that steel tapes were introduced in this country by Col. W. H. Paine about 1870. The use of a home-made steel tape during the same year is described by L. A. Nichols, President of the Chicago Steel Tape Co., in the following answer to our query:

Steel tapes have been used for surveying purposes for probably 100 years. At first these tapes may have been of a nature to make questionable their title of steel tapes; they were measures on more or less narrow, thin pieces of iron, and were used where particular care was required in certain measurements, and preceded the advent of what is known as Gunter's chain.

So far as the writer's knowledge goes, a real steel tape, that is a tape made of steel instead of iron, and of a length which made it really a tape, and graduated at different points, was in use in America prior to the Civil War. It may have been in use for certain purposes a number of years before that date. By the writer's personal knowledge, the first use of a tape in this country occurred in 1870, when some hoop-skirt wire was marked off for measuring bridge spans.

The graduation or marking at first was merely scratched on the steel. As this became easily obliterated, the engineer in charge had solder run on the two sides, and marks made on this solder. Shortly afterward, and within the year 1870, an engineer, a Mr. Wheeler, of Worcester, Mass., obtained some of the hoopskirt steel rolled at the Washburn-Moen Mills in Worcester, put on a drop of solder at each foot and marked the graduations on this solder, the tape being 100 ft. long.

The experiment with this tape was so satisfactory that Mr. Wheeler made several more, and the writer, who was in Mr. Wheeler's party at the time and assisted him, shortly afterward [illegible] and made several short tapes, [illegible] marking the graduations on solder run on the steel.

These, so far as the writer's knowledge goes, were the

first steel tapes ever made with graduations marked on solder or babbitt metal run on the steel. Since then the writer has used these tapes generally, in preference to chains, in his work; and from comments received from other engineers he felt convinced that it was a worthy article of commerce, and in 1900 advertised to make this kind of tape, although as early as the '80s he had made several extra onces and sold them to associates. In 1900 the name, "Chicago steel tape," was adopted for that kind of a tape.

Prior to this, however, if the word steel could be considered in the light of any preparation of iron or bronze, the writer believes he has read in a translation of some foreign work, that a standard of measure made of metal was used in the construction of the Roman aqueducts.

Our own research shows that the first English patent for the manufacture of surveyors' tapes was granted in 1842 to James Chesterman and John Bottom, of Sheffield, County of York. This was for a tape partly or wholly formed of metal. The patent specifications read:

This may be done by means of thin plates of metal or woven metallic fabrics, or by the introduction of fine wires or an open woven metallic fabric in the manufacture of the tape. We prefer, however, introducing fine wires of silver or copper.

This is interesting because it proves that the manufacture and introduction of the well known metallic tape were coincident with the tape made of Sheffield steel. Subsequently, in 1847, James Chesterman was granted a second patent which fully covered the manufacture of steel tapes.

At first these were made of ribbons of steel joined together, and some were plated with copper or tin with engraved graduations. Later it was possible to roll the entire length in one ribbon.

The second patent also covered the machinery for making metal ribbon and metallic tapes, so that for many years Chesterman had a monopoly of the business in Great Britain. For many years, also, Chesterman tapes were used throughout the world. The firm still exists and is still turning out tapes, with which most surveyors are familiar, by name at least.

The only American patent granted previous to 1870 for a metal ribbon tape was in 1860, for a combination of a metal tape and a scale or gage for indicating or setting off the expansion. The tape was defined as a "jointless metal strip." This shows that the tape itself was neither new nor novel in America in 1860.

A Drill Boat Which Lifts Itself Clear of the Water

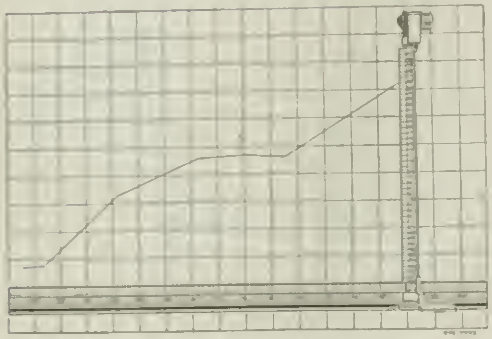
In the harbor of Port Weller, the Ontario entrance of the new Welland Ship Canal, there is now in operation a drill or sounding scow which has the unique ability of lifting itself clear of the water on its own spuds. The two views herewith show the method of operation of the scow. It is about 40 ft. square, of catamaran type, carrying a deck on which is an engine and upon which may be placed an ordinary field drilling machine, such as the one shown in the views. The scow was built for the general purposes of the survey staff of the new canal in connection with the harbor work, but principally to ascertain the elevation of the surface of the rock beneath the overlying material. As it was liable to be caught in rough weather, particularly as the harbor is a new one being built between breakwaters on an exposed shore, a steady platform was required. The engineer in charge first considered using one of the walking stages which were described in Engineering News, Nov. 2, 1911, p. 523, but the present design was found more practicable and cheaper.

Drill Boat Which Lifts Itself Clear of the Water

The scow is framed to slide at each corner through a very heavy spud which carries two sheaves at its top. Over these sheaves passes wire cable from the outer part of the scow to individual engines, one just inboard of each spud. Normally the scow floats as shown in the left view, or is held at anchor in the normal fashion of dredges, but when a more rigid platform is required or when storms approach, the engines are individually started and the scow is lifted up to the position shown in the right view. The engineer in charge of the Welland Canal and responsible for the construction of the scow is J. L. Weller.

NOTES

A New Plotting Scale—The accompanying sketch illustrates [illegible] by Edward A. Zeresh, [illegible] The horizontal arm has a [illegible] graduated. The vertical arm [illegible] perpendicular to the other, has a beveled straight-edge [illegible] and adjacent to this straight-edge there is a [illegible] tape with corresponding



Plotting Scale for Cross-Sections and Profiles

graduations [illegible] over the lower end of the straight-edge and over a movable [illegible] at the top. A projector on the lower part of the arm fits into the groove on the horizontal arm. The device is intended for plotting profiles and cross-sections. The horizontal arm is placed with its straight-edge on the datum line and the tape on the vertical arm is adjusted to this datum line, so that the elevation of the point may be read directly on the arm scale. By use of the horizontal and vertical scales simultaneously, profiles may be plotted rapidly on plain, unruled paper.

A New Pipe-Joint Compound for use on pipe threads [illegible] [illegible] is claimed to have material [illegible] over red lead and other pipe-joint compounds [illegible] has recently been put on the market and is [illegible]

Editorials

The Lavis Subway Articles

In this issue is concluded Mr. Lavis' notable series of articles describing the extensions of the New York subway system—the greatest engineering work now in progress in the world. We feel sure that many of the readers who have followed these pages for the past twelve weeks will be interested to know that the series is to be republished in book form, where it will be more readily available for reference than in the pages of Engineering News. The work which it describes is only about half done, but practically all of the design and the more difficult elements of construction are of the past, so the present text is adequate as a complete exposition of the subject. One further item—the design and construction of the steel elevated structures—will be taken up in a separate article in Engineering News at an early date.

British Sewage-Works Standards

Hard-and-fast standards for the effluent from sewage-treatment works have been the desire and aim of a certain class of sanitary reformers since sewage treatment began. Two years ago, the British Royal Commission on Sewage Disposal, in its Eighth Report, recommended a general standard with variations up or down, according to local conditions. This was a marked advance, but in the opinion of a committee of well known sewage-works authorities, printed nearly in full elsewhere in this issue, the Royal Commission went too far, in that it recommended any sort of a Parliamentary standard.

Instead of a Parliamentary standard, or even a standard set and subject to modification by a central authority, the Committee holds that since "no two cases are precisely similar," a central authority should have power to say what sort of an effluent "any sewage works ought to produce." The object should not be to secure uniform effluents but "to improve or conserve the conditions of the rivers"—quite another matter.

Of course, the Committee believes that all this means a strong central authority, with technical knowledge and with full power to control the character of the effluent from any and all works, and with no overlapping jurisdiction with any other central authority. With this, as well as the other main conclusion of the report, American engineers and sanitary chemists will agree.

Contests in Engineering Society Elections

Most elections in engineering societies, carried on by letter ballot, are tame affairs, as the ticket selected by the official Nominating Committee is voted on without opposition and the result is a foregone conclusion. Occasionally it happens, however, that some candidate named by the official committee will displease a certain proportion of the membership, an independent committee will be organized and another candidate named in opposition. This happened in the recent annual election in the American Society of Mechanical Engineers, and has happened again in the election of the American Society of Civil Engineers, in which balloting is now in progress.

This last contest deserves attention in these columns because of the unusual grounds on which the opposition to the regular candidate is based. The regular candidate, F. A. Molitor, of New York City, is admitted to be an engineer of high standing in the profession and of high ethical standards, interested deeply in the welfare of the profession and of the Society, and in every way competent to fill the position in question. Those who oppose Mr. Molitor base their opposition on the fact that he wrote a letter, published in Engineering News of May 8, 1913, in which he criticized the conduct of the Society's affairs, and enumerated various directions in which, in his opinion, the conduct of the Society could be altered to the advantage of the membership. Mr. Molitor has promptly replied to the circular sent out by those opposing him, stating that he stands by the letter which was published in Engineering News, and if elected to the Board of Direction, will use his influence toward carrying out the changes he has indicated.

So far, the issue would seem to be clear cut, so that the members can vote understandingly, according to their opinions.

It may be worth while to say a word here as to the opinion, which is undoubtedly honestly held by some, that it is not proper for a member of an engineering society to discuss the society's affairs in the columns of a technical journal. This opinion is based, doubtless, on the idea that a technical society is like a family or a social club, whose internal affairs are the business of its own members and of nobody else.

But a great national engineering society is an entirely different sort of organization from a social club of limited membership. The affairs of the American Society of Civil Engineers are of importance and interest, not alone to the thousands of its own members, but to the profession as a whole. Honest and intelligent criticism is a good thing for any organization; and as a matter of fact, the affairs of the national engineering societies have been a frequent subject for discussion in the technical journals ever since the societies were organized and the technical journals were founded.

There is, in fact, no other means by which general critical discussion of the Society's affairs can be freely carried on, since the official publications of the Society are necessarily under such restrictions that they could not give place to such criticisms save in publishing proceedings of the meetings.

It may be said, perhaps, that the place for such criticisms is at the meetings which the Society holds. These meetings, however, for the transaction of general business, occur at long intervals, not more than once or twice a year. The number of members who do or who can attend these

meetings is usually not a tenth or a twentieth of the Society's membership. As a practical matter, therefore, the only means by which a general discussion of the affairs of the Society can take place with free and candid criticism is through the columns of the technical journals.

We could cite instances in which the free discussion in the technical journals of the affairs of other engineering societies than the American Society of Civil Engineers has prevented such societies from adopting unwise policies, and on the other hand, has greatly aided such societies in their development. Under these conditions, it is difficult to see how any sound indictment for disloyalty can be maintained against an engineer because he discusses in the columns of an engineering journal the affairs of the society to which he belongs.

A Derailment Easy to Explain

The Interstate Commerce Commission has just issued an official report on its investigation of a derailment on the Kansas City Southern Ry. on Oct. 19 last. In this accident the locomotive of a passenger train running at 15 miles an hour was derailed, overturned and went down the bank, causing the death of the engineman.

The track on which this derailment occurred was in such bad condition that at some places the gage at the rail joints was 4 ft. 8 in., while at the center of the rail it was 4 ft. 9½ in. Fifty angle bars were found in a short distance having only one or two bolts in them, while some of the rails had no bolt holes drilled in the webs. Twenty-five angle bars were found within a mile which were broken or badly cracked, and in some cases there were spaces between rail ends as great as 2 in. The rail spiking was so poor that many spikes were loose, some of them standing an inch away from the base of the rail; and in one rail only two spikes out of seventeen on the inside of the rail were holding.

The division engineer in charge stated that the appropriation for the maintenance-of-way department was spent in keeping up the weakest points in order to keep the traffic moving, but was barely sufficient to do this, the condition of the track being substantially the same at the time of the derailment as it had been for year previous, although ten or a dozen derailments had occurred during the year.

There can be no doubt whatever that such a railway track as is described and illustrated in the commission's report is unfit to run trains over. The plea may possibly be made that the railway which allows its track to get in such a condition is forced to do so by lack of funds to properly maintain its road. This defense, however, will not bear analysis. The wear and tear of rolling stock operated over such track, with the loss in accidents that are bound to occur, and the increased expense of moving traffic due to the enforced slow speed, all combine to make the running of trains over a track of this sort the worst kind of extravagance instead of economy.

If a railway company is in such financial condition that it has not the money to maintain its track in reasonably safe condition, its officers should not quietly follow the custom of the past, but should notify the state commission that unless permitted to charge rates high enough to provide earnings sufficient to properly maintain the road they will no longer assume the responsibility for the operation of the railway. On the other hand, if a railway company diverts funds that should be applied to track maintenance in order to engage in outside operations or pay unearned dividends, then the state authorities having the power to do so should compel necessary repairs to be made as a condition to continuance of operation.

The Importance of the Local Engineering Society

At a recent meeting of the Seattle Association of Members of the American Society of Civil Engineers, a resolution was adopted requesting each technical society in the city to appoint representatives to form a joint committee which should plan for coöperation between the different societies. We recently reported a similar movement in Philadelphia, where the Engineers' Club is taking the lead toward the organization of a federation of all the technical societies of Philadelphia with the Engineers' Club as a nucleus. These movements are typical of the progress being made in a number of different cities toward the strengthening of the local engineering society.

In an address on Dec. 17, at the annual dinner of the Engineers' Club of Youngstown, Ohio, F. E. Schmitt, of the editorial staff of ENGINEERING NEWS, emphasized the importance of the local engineering society to the engineer and to the community. There is no doubt that the enormous growth of the national engineering societies during the last quarter century has to a certain extent operated to reduce the importance and the strength of the local engineers' clubs. It is true that the national societies have the power to do for their members and for the profession many things that would be impossible for the local society. It is equally true, however, that a local engineering society, properly organized and supported, can yield benefits to its members and to the public which are impossible for the national society.

One of the greatest benefits yielded by an engineering organization is the promotion of mutual acquaintance and friendship among the men engaged in similar work. This was a comparatively easy accomplishment a quarter of a century ago, when the profession was small and the field of work which it covered was limited. At that time it was possible for a member of one of the national societies of engineers to be personally acquainted with a considerable proportion of his fellow members. Under present conditions this is no longer possible. The average member at one of the great national societies probably attends one of its general meetings not oftener than once in four or five years, and probably finds then that he knows only a handful of those present. We are speaking here, of course, of the average member and not of the men in the higher ranks of the profession who by frequent travel are brought in touch with fellow members in the profession over a wide range of territory.

In a local engineering society, on the other hand, holding fortnightly or monthly meetings throughout the season, with opportunities for social intercourse as well as technical discussion, it is easily possible for an engineer to become personally acquainted with most of the engineers in his own locality and not only with those working in his own immediate specialty, but with engineers in all branches of the profession.

The governing bodies of the national engineering societies have come to realize during the last few years, that if these societies would become truly national organiza-

tions, they must establish local branches in the principal cities where their members can meet each other. Simultaneously with the organization of these local chapters or sections of the national societies in different cities, however, the members conducting them have realized that it was far better to merge these organizations in a single strong, local engineering society rather than attempt to keep alive three or four weak, struggling sections of the national societies, able to hold only infrequent meetings and with small attendance and interest.

In the city of Buffalo, for example, there has long been a small engineering society, made up chiefly of civil engineers and holding very infrequent meetings, so that the organization has, we believe, become little more than a name. A year or two ago, officers of the American Society of Mechanical Engineers visited Buffalo and brought together the resident members of that society for the organization of a local section. The Buffalo members in charge of the movement, however, shortly perceived that in order to form a vigorous, useful organization, its membership should not be confined to those already belonging to the American Society of Mechanical Engineers, but all members of the engineering profession should be invited to join. The name of the organization, therefore, was changed to the Buffalo Engineering Society and a strong influential society has been developed there.

There are two cogent reasons why the engineering profession needs strong engineering societies in each important city as well as the national engineering organizations. The first is that the local engineering society can often accomplish more for the profession in keeping its work before the public than can the national societies. The second is that the public is more and more looking to influential organizations of engineers for guidance on important public questions; and a strong local engineering society, officered by men of ability and good judgment, can deal with public engineering questions in a city or county or state that could not possibly be handled effectively by a national engineering society.

We would by no means be understood as doubting in any way the importance of the national engineering societies or undervaluing the service they have rendered and can render to the profession. What we wish to emphasize is that the local engineering society, well supported and properly organized, has a far larger field of opportunity and usefulness than has been generally realized.

Letters to the Editor

Engineering Societies and the Coast and Geodetic Survey

Sir—I have noted with interest and pleasure your editorial of Dec. 17, concerning our effort to get proper support for the Coast and Geodetic Survey. I am particularly grateful for your suggestion that the engineering societies might well come to our assistance. I earnestly hope this suggestion may be adopted. The Coast and Geodetic Survey is an organization which merits the approval and support of all engineers and just at present it needs that support urgently. If the societies would report their action to the Chairman of the Committee on Appropriations, House of Representatives, I am sure that the information thus sent him would be appreciated.

William C. Redfield,
Secretary, Department of Commerce.

Washington, D. C., Dec. 19, 1914.

[We suggest that any engineering society desiring to investigate this matter with a view to action address a request to the Department of Commerce for a copy of Secretary Redfield's annual report, and if fuller information is desired, address O. H. Tittman, Superintendent of the Survey, Washington, D. C.—Editor.

Cycles of Rainfall and the New Bedford Records

Sir—In September, 1913, the writer published an article in the Stone & Webster *Public Service Journal* entitled "Cycles of Rainfall." It is thought that this may prove of interest in connection with X. H. Goodnough's article on "A Century Rainfall Record at New Bedford, Mass.," published in Engineering News for Nov. 19, 1914.

In the article on "Cycles of Rainfall" attention was called to several very general methods of analyzing precipitation data, all of which gave somewhat different conclusions and impressions. By chance the New Bedford records up to 1906 were included in that discussion, although the records for the subsequent years, as given by Mr. Goodnough, were not then available.

The writer's conclusions regarding the occurrence of cycles of rainfall were that cycles appear in all records, but that the magnitude and length of time of the departure from the normal is quite variable at different stations. Some records indicate a decreasing rainfall for a given period, while others at no very great distance may perhaps indicate the very reverse for the same period. Needless to say, all comparisons should be over the same term of years. In general, the occurrence of rainfall might be likened to the waves on the ocean, varying all the way from the little ripple to the big wave, with resultant diversity of period and magnitude.

It is probable that the major variations occurring in a record 100 years in length may become minor variations over a period of 1000 years, in just the same manner that we find variations occurring between 10- or 15-year periods and 100-year periods. This is, of course, only a mere guess, but has been substantiated to the satisfaction of some people, by the size of the annular rings in the large trees of California and by recent theories regarding the effect of sun spots.

It is desired to call attention to the fact that the method used by Mr. Goodnough in preparing his Fig. 2 is similar to the one used by the writer in preparing his successive

ten-year averages, the latter method being first developed by the U. S. Army engineers in a recent report on the Merrimac River. A comparison of the two charts will show quite marked differences in the shape of the curves. These differences are of sufficient amount to furnish quite different conclusions regarding the cyclical occurrence of rainfall.

The stations selected in the article on "Cycles of Rainfall" were chosen not only because of their length of record, but also because it was thought that they were located sufficiently near together to enable tracing out some general similarities. A reference to the tables and diagrams in that article will, however, show that even in a relatively short distance, as from Boston to Albany, or Boston to New Bedford, the records may be quite different in their characteristics, and warrant quite different conclusions.

The writer believes that Mr. Goodenough has chosen the right theory for smoothing out the yearly abrupt changes in rainfall by using progressive averages. Whether the three-year period is better than a ten-year or any other length of period is extremely uncertain. It is true, however, that the length of period chosen may affect conclusions materially.

Taking the New Bedford records alone, perhaps the conclusion might be warranted that a period of exceptionally dry years may be expected to continue in the near future. The study of other long-term records, however, would warrant the conclusion that we have already reached the lowest point in the cycle. The writer believes that the safest conclusion is that no man can predict whether the future rainfall over the country as a whole is likely to be lower, equal to or greater than that of the past few years.

He thinks, also, that when other stations are analyzed as well as New Bedford, when considering the theory of probability and chance, it is quite likely that the next few years will yield better results than have the past few years. This statement is meant to apply to total yearly amounts and not to the monthly or seasonal variations as the writer is not in a position to discuss the latter, or to offer any opinion regarding the question of future summer runoff in the future.

DANA M. WOOD.

Sears & Webster Building, Boston, Mass.,
Dec. 11, 1914.

A Graphic Method of Determining Runoff in Storm Sewers

Sir—I have taken great pleasure in carefully going over "A Graphic Method of Determining Runoff in Storm Sewers," by O. Hufeland, in your issue of Nov. 5, 1914.

It might not be amiss to call Mr. Hufeland's attention to a paper entitled, "The Theory of Storm Water Drainage in Sewer Systems," presented by the writer before the Western Society of Engineers, May 18, 1910. The principles there presented are identical with those mentioned by Mr. Hufeland, and were worked out entirely independently and with no knowledge of a similar development by engineers in Europe.

The graphical part of Mr. Hufeland's paper is new to the writer and would appear to be of a limited advantage over some of the methods of computation employed at Kansas City, where the writer's method was developed.

J. B. BALCOMB,
Executive Engineer, Buena Vista Power & Irrigation Co.
Alberson, Ore., Nov. 16, 1914.

Sir—In presenting "A Graphic Method of Determining Runoff in Storm Sewers" in your issue of Nov. 5, O. Hufeland appears to criticise quite severely American practice in sewer design. The writer wishes to agree that the continued use of the old formulas or of any formula may be attributed to one of the unpleasant reasons cited, and the censure given is well merited.

Mr. Hufeland, however, goes further and apparently disapproves of everything written on the subject in the past ten years. He apparently approves of Kuichling's work (published in 1889) but evidently does not appreciate the widespread application of the resulting "rational method." A number of modifications and methods of design following Kuichling have been published in the last ten years and several others are in use in the larger cities. It is probable that with a little more publicity for the newer methods and further public condemnation of the use of formulas, the rational method will be adopted in all offices where sewerage work is in the hands of specialists.

It will be difficult, however, to persuade the engineers in smaller places, who have many other phases of municipal work to consider, to give the proper time to the study of improved methods of sewer design. And this missionary work is not helped by the exposition of methods carried to an extreme of refinement far beyond the accuracy of the data in hand and obviously involving greatly increased labor. It is, therefore, extremely advisable that nothing be published which would tend to confuse the issue in the minds of those entering the subject for the first time.

The method given by Mr. Hufeland is an interesting study. As presented, however, it is not a method which can be applied directly to the design of sewers. The writer has used for some time a method very similar to Mr. Hufeland's in interpreting the results of coincident rain and sewer-gage operations for a particular storm.

The vital defect in the method as presented is that the whole system of sewers is designed for a particular storm having a duration of t_c and an intensity of q_c. He fails to give any suggestion as to how the choice of this particular storm for any one sewer system is made. Even if he had laid down a rule for choosing the values for this storm and had designed the system according to the procedure indicated, the result would be that one single piece of sewer would accidentally be designed for critical conditions and that the remaining sections both above and below would be too small. This is evident from the fact that the critical rain for the first branch would be the heaviest rain which could last for a time t_c, and by all the laws of probability this rain would have an intensity much in excess of the value of q_c.

Similarly, the maximum runoff in Section 11 would result from a rain of greater duration than t_c, of duration such that the runoff from all the elementary areas would be contributed at one time. Such a rain would naturally be expected to be of less intensity than q_c, but unless the drainage area were of very unusual shape, the

runoff would be greater than for the conditions given by Mr. Hufeland.

The writer is unable to believe that Mr. Hufeland has correctly interpreted the foreign practice quoted, and would be interested in having this work reëxamined in order that what has been published may be properly supplemented and revised.

W. W. Horner.

325 City Hall, St. Louis, Mo.

Sir—In your issue of Nov. 5, 1914, there is an article by O. Hufeland on a graphic method of determining storm-water runoff. Mr. Hufeland is entitled to many thanks for his assault upon the exponential formulas, which, like all popular fallacies, die hard, but why thicken that "fog of theories" to 100% opaqueness by importing an ultra-theoretical method?

Mr. Hufeland asks us to assume that the rainfall commences suddenly, continues uniformly and ceases abruptly. He says that a "definite intensity" means a "rate of precipitation which is *substantially* uniform during the period" (the italics are mine), and this definite intensity is the foundation stone of the method.

To anyone who has even an elementary knowledge of the subject, the salient point about rainfall is that it is decidedly nonuniform. Therefore, how is it possible that results predicated on *substantial* uniformity should hit anywhere near the mark?

It is hard to see why this method by Vicari should be advocated when the best practice in America tends toward the use of Mr. Kuichling's Rational Method, which involves no such absurdities in its theory, and which is much easier to use.

It is true that the Rational Method assumes the maximum discharge to take place when the water arrives from the furthest points and that this is not true for all drainage areas with the hypothetical storm assumed by the Germans. It is a fact, however, that in practice the Rational Method is very near the truth. For here in America the general type of storm is characterized by a moderate rate of rain for a short time, then a heavy downpour that lets up more or less gradually and irregularly. For this type of storm, which we naturally design our drains to carry, the maximum discharge actually does occur when the water from the furthest point arrives, and the Rational Method is theoretically and practically correct.

It is, to say the least, inconsistent to talk of a "fog of theories" and then attempt to promulgate the doctrine that the discharge of a lateral is characterized by a period of absolutely uniform increase, then a long period of constant rate of flow and another of absolutely uniform decrease. That such assumptions are the wildest kind of theorizing is apparent to anyone who has watched a sewer during a storm or inspected a gage record.

Mr. Kuichling is quoted as insisting on the use of "actual uniform intensities of rainfall." The writer of this letter once elaborated a method of computing runoff which was designed to remove some of the theoretical deficiencies of the Rational Method. As a consequence, he enjoyed the acquaintance of the late Mr. Kuichling and obtained his opinions on the subject direct. Neither by any spoken word nor in any published account can he recollect any such statement. The rate of rainfall used in the Rational Method is the *average* rate of rainfall during the period of concentration, irrespective of whether that intensity was constant or varied.

Mr. Kuichling did, however, urge runoff investigators to pay particular attention to those rare intervals when the rainfall is constant or nearly so for a time, for he considered that in this way only could the value of the coefficient of imperviousness be obtained. His insistence was that these values should be rationally obtained and poor guesswork eliminated. The wisdom of this can be appreciated by referring to the values given by Mr. Hufeland. Roofs that shed only 80% of a hard rain are certainly in need of repairs, and pavements classified as "waterproof," which retain 30% of heavy precipitations, demand a graft investigation.

Carl H. Nordell,
Assistant Engineer, Sewerage Commission.
Milwaukee, Wis., Nov. 24, 1914.

Sir—The article on "A Graphic Method of Determining Runoff in Storm Sewers," which appeared in Engineering News, Nov. 5, 1914, is of particular interest to the writer, who has been studying this subject somewhat of late.

Even a slight investigation of the common formulas for runoff reveals their crudeness for use in rational engineering designs, unless they are based on some local conditions unknown to the average engineer, which make them applicable only under the conditions assumed.

One part in the paper is not entirely clear to the writer. The method seems to cover a design which is correct for only one storm of a given uniform intensity for a given or assumed period of duration. What would be the effect upon the design if the storm were of shorter or longer duration with correspondingly greater or lesser rates of precipitation? If the rate of precipitation in inches per hour were a linear function of the period for which that rate were constant, the effect of different storms might be practically negligible. However, the rate of precipitation is not a linear function of the time as is evident from the published curves, showing the observations made in numerous localities.

If my understanding of the graphic method is correct, Fig. 3 or Fig. 4 of the paper can be made applicable to storms of other durations than that assumed in the example by decreasing or increasing the length t_r and using a new vertical scale proportional to the new rate of precipitation. This can be easily done by shifting the curve $A'K'$ to a parallel position. But this will change the location of the maximum ordinate NL, since the points N and L will no longer be in the same vertical. A new maximum ordinate must, therefore, be found for the new condition, and its value, reduced or increased in proportion to the change in the rate of precipitation, compared with the first value obtained. For example, if t_r were reduced, say 20%, or from 20 min. to 16 min., the ordinate NL would be reduced perhaps 10%, while the rate of precipitation might be increased 15%, leaving roughly 5% to be provided for by increased capacity. The section l_{11} still need only be designed for the same capacity as l_a, as shown in the paper.

Now suppose the duration of the storm to be increased 50%, then t_r would be increased 50% and NL might be increased about 25%, while the rate might be decreased only 20%, leaving 5% increase in capacity to be provided for by change in the design. But in this case the section

L_{1} will carry a greater quantity than L_{2}, since the maximum ordinate extends into section (11) of the flow diagram.

It would, therefore, seem to the writer that a complete analysis of the problem would require an extension of the diagram by adding parallel positions of the curve $A'K''$ (Fig. 3) for periods varying by five or ten minutes, from storms of very short duration, which might alter the design of some laterals, to storms having a duration equal to the time required for water to flow from the most remote inlet through the entire length of the sewer. A comparison of the corrected values of the maximum ordinates for the several positions of the curve $A'K''$ will then give the absolute maximum capacity required for the correct design of the sewer. It should be noted that the method set forth by Mr. Hufeland is admirably adapted for the investigation of the effect of various storms, as the labor of finding the length of the maximum ordinate for any storm is very small after the diagram has once been constructed.

Such an extension of the diagram as that suggested above might result in designing a sewer "gradually increasing in size to the outlet," especially when the duration of the storms considered is equal to the time of flow through the sewer and the rate of precipitation is heavy.

R. D. Goodrich,
City Engineer.

Cheyenne, Wyo., Nov. 12, 1914.

[Replies by Mr. Hufeland to each of the foregoing letters follow. — Editor.]

Sir—I am under obligations to J. B. Balcomb for calling my attention to his paper of 1910, one of the few that I had not seen when I wrote my article. It is interesting in this connection because of the cumulative method which he describes and which resembles the Vicari method in that he draws curves for each drainage unit and adjusts their relation to each other to correspond to the time required for the flow from one unit to reach the next. On page 8 of his paper he says:

A really rational method would consider each sewer an entity—treating it as though it were the only storm drain in the city. This would mean determining the time of storm concentration, the imperviousness of the surface, the frequency with which it would be permissible to flood it, a precipitation curve suited to the particular circumstances, etc.

With the method described by me every one of these requirements can be provided for with the minimum [illegible] [illegible] of labor.

Answering W. W. Horner, I do not "disapprove of everything written on the subject in the past few years." I am also aware of the seven or eight modifications of Mr. Kuichling's work, some of which seemed rather expensive [illegible] [illegible] [illegible]. My "disapproval," if the [illegible] [illegible] word is permissible, is confined to the publication of complicated formulas involving [illegible] [illegible] computations that are based on a few reliable data. A thirty years' experience in sewerage practice and a personal acquaintance with some of those who wrote these papers led me to draw the [illegible] of some of the [illegible]. [illegible] [illegible] American practice, I [illegible] [illegible] American theory as it is [illegible] [illegible] [illegible] [illegible].

The third paragraph of Mr. Horner's letter [illegible] [illegible] [illegible] a [illegible] of personal opinion and I concede only his right to hold the opinion there expressed. The charge that the method proposed is one of "extreme refinement, etc.," embarrasses me somewhat because some of the comments made to me complain of the reverse.

I have answered Mr. Horner's letter so far as it relates to the personal views expressed in the article, but a discussion of the Vicari method would take more room than could be devoted to it in a letter. I do wish to call attention, however, to the fact that the correctness of the graphic method described has nothing to do with the storm selected, nor with the percentage of runoff, nor with the velocity formula used. The article clearly states that its use is based on the "acceptance of the postulate 'that a definite intensity of rainfall during a definite period must result in a definite maximum of runoff, but that this maximum does not necessarily occur when the runoff from the whole area reaches a given point in a collecting sewer.' A definite intensity means, of course, a rate of precipitation which is substantially uniform during the 'period,' etc." If it is correct to use the data available in the above way, the result given by the graphic method should be correct. I will concede that some engineers do not believe that the quantity of storm water reaching a sewer can be determined in so direct a manner. Mr. Kuichling was one of those who did and the writer agrees with him.

At some other time I hope to be able to present data justifying the latter view.

Carl H. Nordell's letter evinces a degree of heat that does not seem to be warranted by the criticisms which he makes. I am quite familiar with the "Uniform Method of Runoff Determination of Storm-Water Sewers" which he presented to the Municipal Engineers of New York in 1909. While very painstaking, it was an effort to prescribe a theory based on very few data, resulting in a theoretical rainfall curve and a slide-rule for sewer computation (now in the market), based more or less on this curve. With the adoption of any other method, particularly if it is one that, due to its simplicity, may find a larger application, his theory and slide-rule will suffer more or less from discredit.

Of course every writer on this subject today talks of the rational method, and [illegible] [illegible] with Mr. Kuichling's name in connection with it, often, as I have said in my answer to W. W. Horner's letter, to Mr. Kuichling's sorrow and anger. To soothe Mr. Nordell in that respect, I will inform him that Mr. Kuichling read my article, took down his copy of [illegible] of the date of 1909, said he had seen the method, and his marks in the book proved it, but had dismissed it because at the first glance it seemed to be based on a table of runoff that he thought was wrong. In that respect he was like Mr. Nordell, who also objects to the runoff, but when I pointed out to Mr. Kuichling that these figures "had nothing to do with the case" he tabled Mr. Nordell's [illegible] again and said in his emphatic way: "It's a damned good thing." That illustrates the difference between Mr. Kuichling and Mr. Nordell. The [illegible] [illegible] [illegible] of making a definite intensity the [illegible] [illegible] [illegible] of the method, I admit it.

Whether I have "next to elementary knowledge of the subject" of rainfall, as compared with the [illegible] [illegible] [illegible] knowledge of Mr. Nordell, is not for me to determine, but I hope in the near future to lay before the engineering profession a careful analysis of a very

long period of rainfall records from self-recording gages which may interest those who still have something to learn of this vexed subject. Unfortunately, I do not deserve the credit for the method with which Mr. Nordell finds so much fault, but have merely made accessible to some engineers a not altogether new help in computation. As I have said in my article, it is a free translation and the credit for it or the lack of "even an elementary knowledge of the subject" must fall on K. Meier, Chief Engineer of Sewers in the city of Berlin, Germany, who wrote the original in "Hütte." My guilt is confined to the "importing," as Mr. Nordell expresses it.

R. D. Goodrich's understanding of the method is quite correct. Not only the maximum flow for the whole area, but the flow through any of the laterals at any period of the storm, will be represented by the ordinate for the time required.

One gratification furnished by the letters on this subject that have reached me is the conviction that the exponential formula is rapidly going to its long deserved obsolescence.

O. Hufeland.

Municipal Building, New York City, Dec. 21, 1914.

NOTES AND QUERIES

The thickness of the asphalt pavement on the Junipero Serra Boulevard, San Francisco, Calif., is 2½ in. and not 3 in., as stated in the caption under Fig. 3, p. 1182, in our issue of Dec. 10, 1914. Also, through an oversight, the author referred to the bituminous rock deposits in the vicinity of Santa Cruz as biteminous limestone. These deposits are bituminous sandstone.

On Establishing and Enforcing a British Standard for Sewage Effluents

A brief but important British report on a standard for sewage-works effluents and means for the enforcement of such a standard, has been made public. The committee was selected by the Association of Municipal Corporations and its members were chosen "for their skill in the design and maintenance of sewerage and sewage-disposal works." The report was submitted, on behalf of the committee, by its chairman, John D. Watson, Engineer to the Birmingham, Tame and Rea District Drainage Board, Tyburn, Birmingham, England.*

The deliberations of the committee were on the recommendations of the Royal Commission on Sewage Disposal dealing with standards of purity (Summary of Conclusions, par. 62, p. 17, Eighth Report; see Engineering News, Jan. 9, 1913).

After introductory statements the committee declared that although it believed British legislation on stream pollution (Public Health Act, 1875) "is greatly in need of amendment," yet "it is not desirable that standards of purity be prescribed by Parliament as the Royal Commission recommend." The remainder of the report, which is also the substance of the document, reads as follows:

4. The discussions established the fact that the Committee are in complete agreement that the law as it stands is greatly in need of amendment, but that it is not desirable that standards of purity should be prescribed by Parliament as the Royal Commission recommended.

5. The predominating factor in considering the advisability of creating a standard by Act of Parliament is the fact that no two cases are precisely similar. Differences manifest themselves in the character and volume of the stream into which the sewage effluent is discharged, and in the strength and characteristics of the sewage itself. In practice it is found that the strength of the sewage varies considerably even during a day of 24 hours, that no bacteria bed or irrigation field emits effluents of unvarying quality, and that it is unreasonable to expect a purification plant of excellent design and ample capacity to give as good results during a time of abnormally cold weather as it would during a normal season. If such a plant were large enough to produce a standard effluent in mid-winter, it would obviously be too large and expensive to meet the demands of the statute at other seasons, and vice versa.

6. In view of these varying conditions, the Committee think that it should be left to a central authority possessing adequate technical knowledge and power to determine finally all disputes, whether with public authorities or private persons, relating to the quality of sewage effluents, effluents from storm-water tanks, or any other liquid discharges into tidal rivers, streams, canals, ponds or lakes, and to settle any incidental questions, such as the amount of compensation or damages. Such central authority should not only have power to indicate the quality of the effluent which any sewage-works ought to produce, but should also have power to make regulations as to how and when samples should be taken for the purpose of ascertaining whether such effluent is produced.

7. The Committee have come to this view with reluctance, as they are aware of the prevalent objection to multiplying Government Boards, but they see no workable alternative to giving a Government Department absolute power to determine what must be done in individual cases, unless setting up a standard of purification by Act of Parliament. The latter course they believe to be quite impracticable, and any suggestion to make it less impracticable, by authorizing the central authority to override the statute in the interest of a municipality for any reason whatever, would probably be unsatisfactory even to the community in whose interest the concession is made.

8. Any amendment of the law should be to improve or conserve the condition of the rivers, and not to compel municipalities to discharge sewage effluents of uniform quality. The authority of the central authority should be paramount, and every municipality should be obliged to accept their dictum as to what is necessary; not, however, until a careful and unbiased inquiry into all the circumstances of each case has been made. As the judgment of the Local Government Board in reference to size and form of tanks, capacity of bacteria beds, etc., is now accepted, so should the decision of the central authority be accepted, in all matters relating to the pollution of rivers; and as the Local Government Board have power to vary their requirements as a condition of sanctioning a new loan, so should the central authority have power to vary their requirements as a condition of assuming responsibility for allowing effluent to enter a stream.

9. Whether the central authority should be affiliated with the Local Government Board, or with a new department under a Public Health Minister, it is not for this Committee to discuss here, but there should be no overlapping, and it should not be possible for one authority to order works to be constructed which another authority might deem useless or redundant.

10. The Committee believe that a central authority could greatly help municipalities by establishing and maintaining a national research department.

*Among the other members of the committee were Gilbert J. Fowler, of Manchester, Geo. A. Hart, of Leeds, Joseph Garfield, of Bradford, and E. G. Mawbey, of Leicester. The report was dated Oct. 3, 1913, but was not made public until a few weeks ago. The report was addressed to H. G. Pritchard, Secretary, Association of Municipal Corporations, 9 Bridge St., Westminster, S. W., England.

Sewage Disposal for Indiana Cities by discharging the sewage into the Chicago drainage canal instead of into Lake Michigan has been proposed by the Sanitary District of Chicago as a means of reducing the pollution at the southern end of the lake. The cities in question are Whiting, Hammond, East Chicago and Gary, and the Sanitary District has offered the use (without charge) of the new Sag Canal, which is now being built from the Calumet River to the main drainage canal. The cities will vote in a few months on the acceptance of this proposition, which will involve a rearrangement of the sewers and the construction of the necessary connections.

The Failure of the Hippodrome Arcade, Youngstown, Ohio

On Oct. 26, 1914, a section of the reinforced-concrete part of the new Hippodrome Building, under construction in Youngstown, Ohio, collapsed and carried down in the [illegible] a number of workmen, three of whom were killed in the accident. Engineering News has refrained from any discussion of the design or construction of this building, or of the causes of its failure until the results of official investigations might be available. It now appears extremely unlikely that any such official investigations will take place, so an effort has been made to procure all possible information regarding the building with a view to establishing, if possible, the cause of the failure.

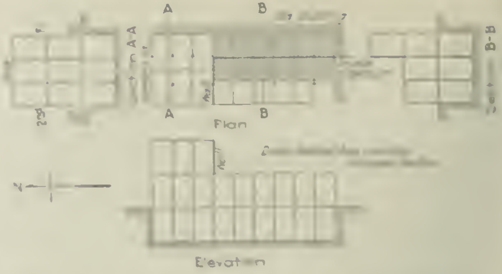

Fig. 1. Outline Plan and Sections of the Hippodrome Building Arcade, Youngstown

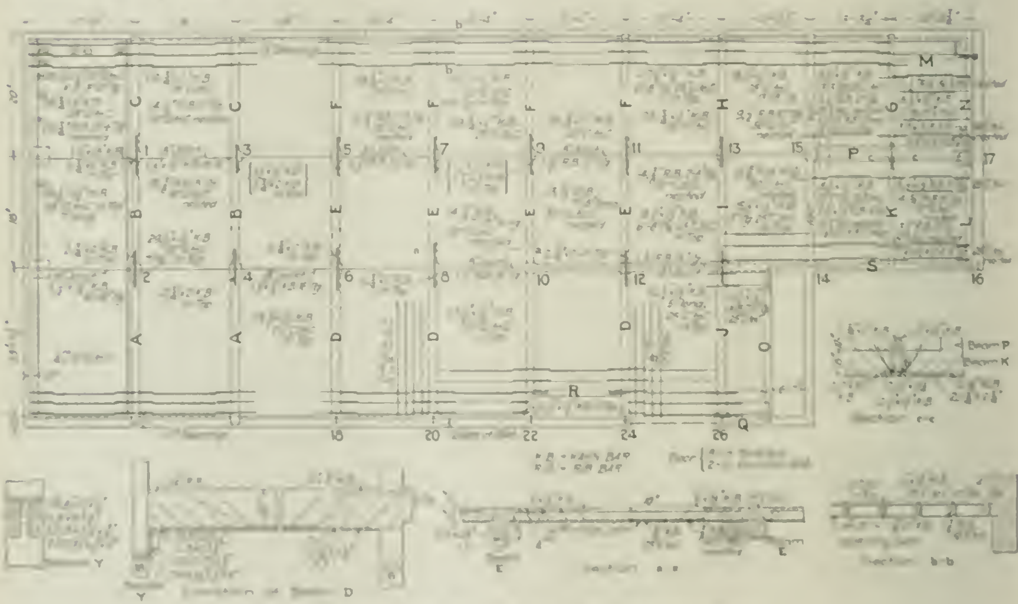

Fig. 2. Details of First Floor, Hippodrome Arcade

The following data regarding the design of the building are authoritative, inasmuch as they are based on drawings and computations freely offered to the investigator. The statements regarding the construction of the building on the other hand, while made only after the most studied effort for accuracy, are subject to the doubt which must affect all [illegible] testimony and eye-witness statements.

GENERAL DESIGN

The Hippodrome Building, in Youngstown, is a steel [illegible] structure, having at one side of the main auditorium an arcade and office building, mainly two stories and basement in height, which opens on [illegible] St. at one end and which at the other end is reached from Federal St. through an arcade built part way in an old structure facing Federal St., and the rest of the way in the new Hippodrome addition.

As originally designed, the whole building (theater and arcade addition) was of steel construction. Some time after the letting of the contract, however, the contractors,

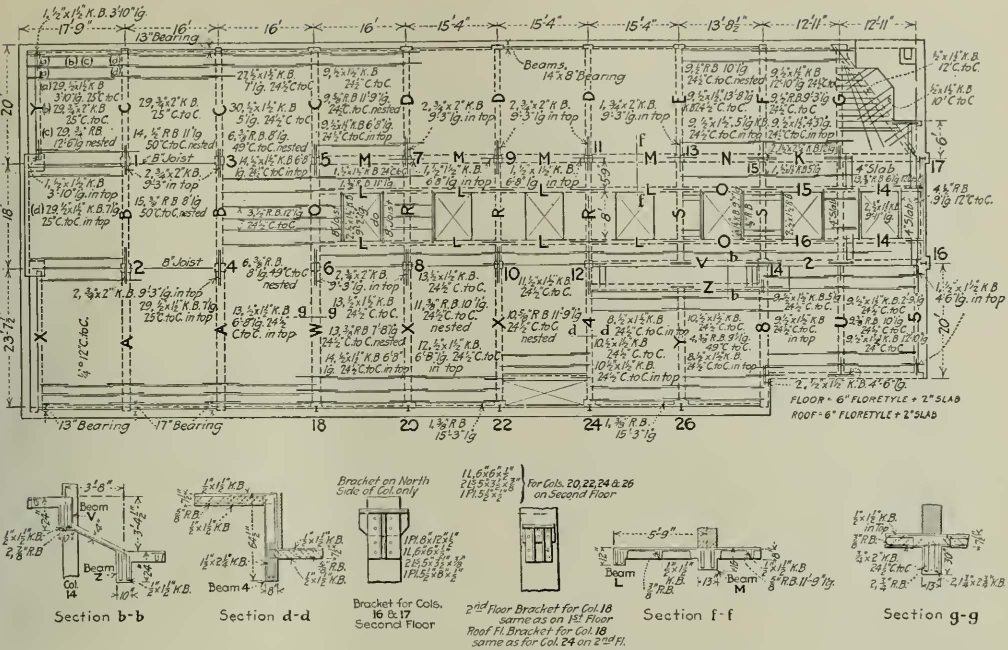

Fig. 3. Details of Second Floor, Hippodrome Arcade

with the full approval of the architects and of the architects' engineer, changed the design of the arcade addition to reinforced concrete. Work was proceeded upon on this basis.

The building was designed by Knox & Elliott, architects, of Cleveland, Ohio, who had for their structural engineer, J. C. Spencer, M. Am. Soc. C. E., also of Cleveland. The reinforced-concrete design for the arcade was made by the Trussed Concrete Steel Co., and approved by the architects. The building is being erected by the George A. Fuller Co., under the direction and inspection of the architects.

The arcade addition is in plan a rectangle, 151 ft. long and 62 ft. wide, and has in its main section two stories and a basement, the first floor being at the street level. The framing is complicated by the central arcade, but can be understood from the following description and a study of the accompanying drawings.

In general, the building is divided into three bays across its narrow portion and nine bays along its length. The arcade extends north six bays from the south end of the building. The northerly three bays are all two stories and basement high, but in the southerly six bays the easterly bay is two stories and basement high, and the westerly two bays, one story and basement high, with the arcade in the center bay. The west and south sides of the second story of the building have brick curtain walls pierced with numerous window openings and resting on the reinforced-concrete beams of the frame.

Reinforced-Concrete Design

The reinforced-concrete design comprises columns spaced in fairly uniform bays, carrying transverse girders which, in turn, carry the closely spaced beams of a beam-and-slab floor. The only variation from a normal reinforced-concrete frame is caused by the exterior wall

[illegible]. The [illegible] wall is the curtain between the theater and the arcade and is carried on the steelwork of the theater; the reinforced-concrete girders of the arcade frame into the steel columns of the theater and rest on brackets provided for that purpose (see Fig. 3). The north or street wall is carried on pilasters into which the various floors frame. The east wall is a brick bearing wall with pilasters, in which rest the girders and slabs of the floors. The design here calls for 13 to 14 in.

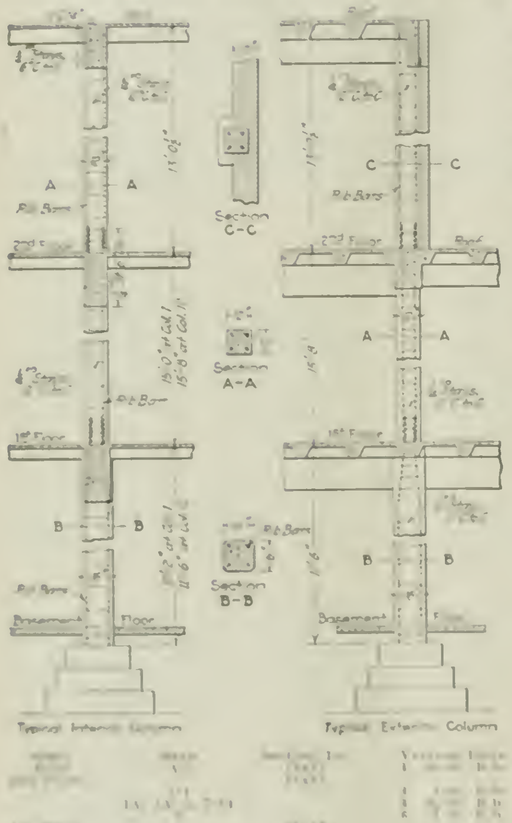

FIG. 4. COLUMN DETAILS

bearing for each girder and at least [illegible] in. bearing for all slabs. The south wall is the old brick wall of the adjoining building. In the westerly panel, there being a stairway well in the southwest corner, the floor was carried in girders out to this wall; but the middle panel was to be carried on steel columns provided for the purpose. The construction at this point is quite critical and is described in detail later in this article.

COLUMNS—The column details are shown in Fig. 4. They rest on concrete footings of low soil pressure and are reinforced at the four corners with straight rods tied together every 10 in. with wire. They vary from 18x18 in. in section in the basement floor to 12x12 in. at the second floor. The columns in the theater section wall, that is, the west side of the arcade, are of steel H-section, and carry on their other side the framing for the theater floors. They are provided on the arcade side with brackets (see Fig. 3), having a 6-in. outstanding leg, on which rests the girder.

GIRDERS—The girder schedules for a number of the girders are shown in Figs. 2-3. These are typical. The girders are reinforced with straight rods with integral stirrups (Kahn type) and, where required, by deformed bars, rested in the pronged bars and bent up to go over the supports. In other girders continuity is provided by one or more separate Kahn bars, turned upside down and placed in the upper part of the beam over the column. At both the east and west walls the girders have only a bearing with no very effective steel continuity into the wall or column; they are figured as semi-continuous for these two outside panels.

FLOORS—The floor-slab detail is shown in Fig. 2. The intermediate beams of the floor slab are parallel to the long side of the building and frame into the main girders, and continuity over these girders is taken care of by rods in the upper part of the beams. The slab is formed by the so called "floretyle," that is, the opening is made by a pressed-steel continuous form, which gives the required shape.

LOADS AND STRESSES—The design was made according to the following specifications:

Span length, center to center of span;

f_s = 16,000 lb. per sq.in.;

f_c = 700 lb. per sq.in.;

Shear in concrete = 60 lb. per sq.in.;

Compression in concrete in columns, 500 lb. per sq.in.;

Moment coefficient of partially continuous span, one-tenth; fully continuous, one-twelfth; negative moment over support, fully continuous beams, one-twenty-fourth.

Figuring live loads for columns, 25% reduction is made for the second floor and a 30% reduction for the first floor.

The loads on the first floor for floor design were 150 lb. live load + 18 lb. for floor finish + 5 lb. for ceiling; for the second floor, 100 lb. live load + 16 lb. finish + 5 lb. ceiling, and for the roof, 40 lb. live load + 24 lb. finish + 5 lb. for the ceiling.

All beams and columns were figured according to the principles laid down in the report of the Joint Committee on Concrete and Reinforced Concrete, following the above noted specifications. The editors of ENGINEERING NEWS have not checked the whole design, but they have checked a number of the members, both beams, columns and slabs and have found that they are designed within the specifications laid down above.

COLUMNS 16 AND 17.—With one exception, the design was followed in construction. This exception is, however, rather important and should be noted in detail.

The plan in Fig. 2, which in this respect at least is a facsimile of the concrete drawing, shows the 2d floor columns 16 and 17 at the south entrance to the arcade. The detail in Fig. 3 shows also the bracket provided on the reinforced-concrete drawings to carry Beams K and 2 on Columns 17 and 16, respectively. The steel columns at these points were provided in the original design to carry

not only the steel-beam framing of the arcade, but also a new lintel over the arcade under the old wall of the building, which lies to the south of the arcade. The steel drawings, which were turned over to the reinforced-concrete designers, showed steel columns at this location and they assumed that such were required, and therefore left the column design as it was and provided steel brackets onto which to rest the concrete beams.

The construction was proceeded with upon this basis. The steel columns shown were detailed by the engineer, ordered, fabricated and brought to the job, as was also

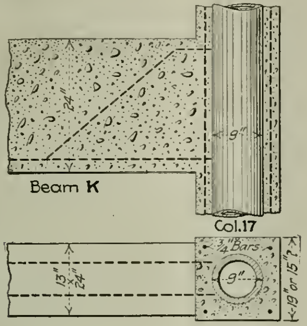

Fig. 5. Sketch of Connection of Beam K to Column 17, as Built

the steel I-beam lintel. When construction reached this point, however, and the brick wall was pierced, it was found that it had been carried across this space on an I-beam lintel and there were in the location of these steel columns two 9-in. cast-iron columns on which the steel lintel rested. After due consideration on the part of the architect and the engineer, but without consultation with the reinforced-concrete designer, it was decided to clear out the brick wall from around the cast-iron columns, to incase them with concrete and to rest Beams K and 2 on this concrete.

Testimony is somewhat vague as to the precise method by which this connection was made, but according to our best information the sketch in Fig. 5 shows the condition at Column 17, which presumably was duplicated at Column 16. It will be seen that the 9-in. cast-iron column was incased with concrete to make a square 19-in. column (other testimony is to the effect that this incasement made only 15 in. square), which concrete incasement was reinforced with four ¾-in. rods, one in each corner of the square. Into this the 13x24-in. Beam K was framed, having for its sole bearing the 5 in. (or, according to the other evidence, 3 in.) on the concrete casing of the cast-iron column feebly reinforced by the slender rods. The reinforcement of Beam K was continued up to as close as possible to the cast-iron column, which incidentally had its top some inches above the top of Beam K.

Construction

Construction of the concrete portion was started early in September and the various parts were begun on the following dates: Basement columns, Sept. 22; first floor, Sept. 23; second floor, Oct. 2; roof concrete, about Oct. 19; roof covering of cinder concrete, Oct. 21. On Oct. 26, at 4:45 p.m., that part of the reinforced-concrete structure lying east of the west arcade columns and south of the transverse arcade wall (shown in the plan in Fig. 1) collapsed without apparent warning. The collapse was complete from roof to cellar and the testimony of eye witnesses is so vague and confused that it cannot be determined in what part of the structure failure started nor in what manner it progressed. The five columns (numbered 7, 9, 11, 13 and 15) in the collapsed zone were thrown down, except that a stump of Column 7 remained standing. The girders at the east wall were pulled clean from the wall, as was to be expected inasmuch as their connection there was one of bearing and not of reinforcement. The girders on Columns 6, 8, 10, 12 and 14 were sheared off quite clean at the column head, and the rods which extended up into those columns and over the column head to insure continuity were pulled clean from the concrete of the beam. The plane of the floor slabs in the débris sloped down from either side of the break. The breaks at Columns 17 and 16 were clean, with no indication of any rod tie into the concrete surrounding those columns. Testimony is not clear as to whether the concrete casing of the cast-iron Columns 16 and 17 were sheared off beneath the bearing of the beams which framed into them or whether the break was in effect a continuation of the plane of the column casing.

Material—The cement used in the structure was the Alpha brand, which was tested by the Pittsburgh Testing Laboratory and which passed with a good margin all the standard specifications for portland cement.

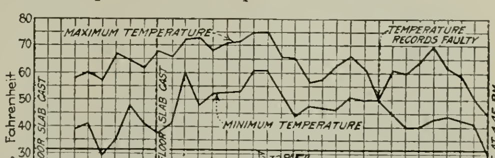

Fig. 6. Temperature Record, Youngstown, Ohio, Sept. 23-Oct. 26, 1914

The aggregate was a separated sand and gravel coming from the local pit of the Concrete Stone & Sand Co. This aggregate is decidedly subject to suspicion. The testimony of a number of competent engineers in the Youngstown district is to the effect that it has a decided tendency toward loaminess and that it should never be used for reinforced-concrete work. So far as we were able to discover, it never had been used previous to this construction in reinforced-concrete work, although it has been used for concrete on street-paving work in Youngstown. The building inspector of the City of Youngstown states that he inspected the sand for the Hippodrome job and never found more than 4% loam, the inspection being the ordinary rough test in a graduated glass of water. The reinforcing steel was furnished by the Trussed Concrete Steel Co. There seems no reason to believe that this steel is in any way responsible for the failure.

The concrete was mixed in a batch mixer and in 1 : 2 : 4 proportions, and chuted into place from the high adjoining roof of the theater building. The chute was at a steep angle so that it was not necessary to add any great excess of water to make it flow freely. The temperature

during the laying of the concrete is shown in the accompanying Fig. 6, which record is taken from a local newspaper's recording thermometer for three-hour intervals throughout day and night, except for the period each week from 3 p.m. Saturday to 9 a.m. Sunday, when no record was taken. From this it will be seen that just after the casting of the basement columns was a three-day period of quite low maximum temperature, with at least one day below freezing. From that time on until ten days before the collapse, however, the thermometer was well above freezing. A cold spell set in the day of the collapse, and snow fell that night.

Struts—The struts to support the floor consisted of [illegible] spaced about [illegible] in both directions and braced with at least one horizontal line of plank.

The question of strut removal under the floors is an extremely difficult one. Everyone connected with the building admits that the struts under the first floor, that is, the basement struts, were removed entirely at least a week before the collapse. It is agreed also that the struts were still under the third-story roof. There is, however, some question about the struts under the arcade roof and the second floor—that is, the struts in the street story. The contractor's superintendent states that while some of the struts in the north end of the building (the portion which did not collapse) had been removed on the night of the collapse to allow the tearing down of box forms preparatory to putting up the ceiling, he is emphatic in his statement that none of these struts under the collapsed portion of the second floor had been removed up to the time of the collapse. The city's assistant building inspector states that at nine o'clock on the morning of the collapse (the last time he was on the job before the failure) some workmen were taking down some of the struts in the collapsed portion of the first floor, but were taking them down one at a time in order to permit the removal of some of the box forms under the beams and slabs and were replacing the struts as the boxes were taken out. Some outside observers state that at three o'clock on the afternoon of the failure they noticed carpenters removing some of the struts on the street floor under the collapsed portion of the building, but they are unable to testify certainly that these struts were not replaced one by one as they were taken down. That part of the building which remained standing after the collapse was fully strutted.

Concrete—Specimens of concrete from the fallen floors and columns seemed entirely satisfactory, although there are no available tests from which its strength might be determined. However, there are two [illegible] of concrete in evidence [illegible] which might [illegible] taken from [illegible] the day of the failure [illegible] the head of the [illegible]. The [illegible] some ten weeks later were [illegible] of the concrete, indicating that a certain degree of set had then taken place. There is no way of proving [illegible] where this particular concrete was [illegible] in the building. It might have been [illegible] which was at most seven days old at the time of the collapse. At any rate, these concrete specimens [illegible] which were examined are not what would be called good concrete. It had reached a [illegible] set, as would be expected [illegible] but it [illegible]. In its present condition it undoubtedly would not be [illegible] a cause of a concrete failure, but its present condition also would throw considerable suspicion upon its strength at the time of the failure.

CONCLUSIONS

There are three factors which may contribute to the failure of a reinforced-concrete structure; the design, the materials and the construction.

The design of the Hippodrome arcade is somewhat less conservative in unit stresses than the report of the Joint Committee, but in that respect it does not differ from many other accepted reinforced-concrete designs, nor can it be said these higher stresses are so dangerous as to cause failure. In the matter of beam reinforcement and connections, and column reinforcement the design follows standard practice and is at fault only so far as that practice is at fault.

Of the materials the cement and steel are beyond suspicion, but the concrete aggregate had a bad reputation in general and in this particular job was of doubtful quality, for the reports on its freedom from loam are not reassuring. In fact, it seems probable that the set of the concrete was retarded by the character of the aggregate to such an extent that its strength at the time of failure was considerably less than it should have been. While there is no absolute evidence that this poor aggregate or resulting poor concrete was the cause of the collapse, suspicion may justly be directed toward it.

The construction was carried out by an experienced contractor of high reputation under the inspection of the architect. Except for the fact that the city's inspection service was perfunctory (a common enough condition) and the reinforced-concrete designer had no responsibility for the construction, the conditions of erection were ideal. The resulting work was satisfactory, except for the possible premature removal of forms and the elimination of the bracket from Columns 16 and 17, as noted above.

It seems probable—and this statement is made after listening to two absolutely contradictory statements by equally reliable men—that there was no intention to remove forms under the second floor on the day of the accident, but that there was a progressive removal and replacement of some of the struts, which might have thrown some of the girders into bearing. In view of the fact that there had been some cold weather and particularly in view of the poor aggregate, it is more than probable that the girders thus relieved would be strained to the point of failure, although they were at the time over three weeks old. The connections of Columns 16 and 17 were doubtfully weak and if the beams framing into these columns were thrown into stress by the removal of the centering, failure might readily have occurred there. It should also be noted that the centering under the first floor was removed when the columns and beams there were about four weeks old. While this is ample time under ordinary conditions, the aggregate and the temperature make this another possible failure point.

The final conclusion then is that the design of the structure was ample to have held up under the loading conditions at the time of failure if the concrete had had the expected strength of a 1:2:4 concrete three to four weeks old. That leaves as an alternative either that the basement columns and first-floor girders were not sufficiently strong at the time of collapse to carry the upper floors, or that the partial removal of struts at the street floor threw an excessive strain on the obviously weak concrete of the second floor.

An Example of Fire-Resistant Windows and Structure

The recent successful fire test passed by the new building for the Reliance Gauge Column Co., Cleveland, Ohio, is a very good testimonial to the possibilities of really fireproof construction. This company had a new building nearly ready for occupancy, when on Dec. 14 last, at 2 a.m., a fire broke out in an immediately adjoining frame building. The engines, which were soon called, were in service until 5:30 of the same morning, by which time the frame building had been totally destroyed. The fire

Fig. 1. Interior of First Floor of Reliance Gauge Column Co.'s Building, Cleveland, Ohio, after Fire of Dec. 14

(Note that the whole damage is the warping of the steel sash, the breaking of one or two of the wire-glass panes, and the removal of an entire steel window frame to permit the entrance of firemen to fight the fire outside. The building was about to be occupied and contained considerable loose timber.)

Fig. 2. Appearance of the Concrete, Brick and Stone Face of Reliance Building after Fire of Dec. 14

was intensely hot as the frame building was over 30 years old, and during that time had served as a home for a number of manufacturing concerns, with the result that it was very thoroughly dried out and fairly well saturated with oil.

The new Reliance Gauge Column Co. building is a four-story structure with reinforced-concrete frame, brick curtain walls lighted with factory-ribbed wire-glass in steel sash. At a somewhat greater distance from the frame building was a brick building with wooden window frames and fire shutters of wood coated with sheet metal. In this latter building a number of the shutters were badly damaged and some of the window frames were nearly destroyed. Its contents were damaged to the extent of \$5000 by fire and water.

The new reinforced-concrete building was immediately alongside of the burning structure and exposed to the full heat of the conflagration, but it resisted the fire with hardly any damage. In order to get at the blaze outside the firemen found it necessary to remove one of the steel window frames on the first floor. This was very difficult on account of the secure manner in which the frames were anchored into the structure, but by the use of a block and fall with twelve men on the line, the frame was finally torn loose and the building entered. Except for this damage and for one or two window panes broken during the fire, the damage to the concrete building was confined to the surface effect on the brick and concrete, which is well shown in the view in Fig. 2. The intense heat of the fire, it may be noted, spalled off the brick walls and the stone window sills on the second floor there shown.

The steel sash, which was of the Fenestra type, made

by the Detroit Steel Products Co., of Detroit, Mich., was warped in places, but in spite of this warping the joints around the ventilator section of the sash remain comparatively tight.

A Prominent Firm of Early American Bridge Builders

Some time ago, in an article in ENGINEERING NEWS, describing some old structural work, mention was made of "a Mr. Wilson, of Philadelphia," as having been connected with its design. This reference was to a member of the firm of Wilson Bros. & Co., whose members were among the notable bridge designers and builders in this country during the period following the Civil War.

The firm of Wilson Bros. & Co., Civil Engineers and Architects, was founded in January, 1876, by John A. Wilson, Joseph M. Wilson and Henry W. Wilson, all Members of the American Society of Civil Engineers. They were the sons of William Hasell Wilson, Honorary Member of the American Society of Civil Engineers, and also grandsons and great-grandsons of distinguished American civil engineers. John A. Wilson died Jan. 19, 18[illegible], and Joseph M. Wilson, Nov. 24, 1902. The other brother, Henry W. Wilson, still lives in Philadelphia. After the death of the two elder brothers, the firm became Wilson, Harris & Richards, with Mr. Wilson as senior partner. Since he retired, about four years ago, the firm has been Harris & Richards.

John A. Wilson was born in 18[illegible]. He graduated from Rensselaer Polytechnic Institute in 1856 and some of his earliest engineering experience was with John C. Trautwine, as topographer on railway surveys in Central America. From 18[illegible] until the formation of the firm of Wilson Bros. & Co., he was with the Pennsylvania R.R. and its subsidiaries, except during the Civil War period, when he served as Captain on the staff of General Couch. Mr. Wilson was at various times Chief Engineer of the Philadelphia & Erie R.R. (Pennsylvania R.R. Co., lessee), Chief Engineer of Maintenance of Way on the main line of the Pennsylvania R.R. and Chief Engineer of Location and Construction of the Low-Grade Division of the Allegheny Valley R.R. He was a member of the American Institute of Mining Engineers and of the Franklin Institute.

Joseph M. Wilson was born in 18[illegible] and graduated from Rensselaer Polytechnic Institute in 18[illegible]. He entered the service of the Pennsylvania R.R. in 18[illegible] and in the course of a few years became Engineer of Bridges and Buildings, which office he retained until 18[illegible]. He served as Engineer and Expert for several Commissions on [illegible], including the Washington, D. C., tunnel and [illegible], the Providence, R. I., terminal [illegible], [illegible] of the Brooklyn Bridge, New York City, and New York City rapid-transit problems. He was the author of many papers and articles on engineering subjects. He was a member of the Institution of Civil Engineers of Great Britain and a winner of the Telford Premium of that Society, a Fellow of the American Institute of Architects, a past president of the Franklin Institute and of the Engineers' Club of Philadelphia.

Henry W. Wilson, the surviving brother, was born in 18[illegible]. He graduated at the Rensselaer Polytechnic Institute in 18[illegible]. He had engaged as surveyor for the Southern Pennsylvania R.R. in southern and western Pennsylvania as Assistant Engineer. In 1866 he resigned to enter the service of the Pennsylvania R.R. Co., where he was employed in bridge designing and in construction work until he entered the firm of Wilson Bros. & Co.

Notes from Engineering Schools

YALE UNIVERSITY—Land for a summer surveying camp has been obtained by the Sheffield Scientific School. It is located in East Lyme, Conn., about 40 miles from New Haven and easily accessible by the Shore Line Electric Ry. A number of farms have been purchased, which, with a strip of land donated by Morton F. Plant, make a tract $3\frac{1}{2}$ miles in length and $1\frac{1}{2}$ wide in portions, altogether embracing more than 1400 acres. The topography is varied and is adaptable to all kinds of surveying work. For over a mile a portion of the land borders on an inland lake. Rising up from the lake is elevated ground, making an admirable location for the camp site.

CORNELL UNIVERSITY—This fall, for the first time, the entering class in the five-year course in mechanical engineering registered in Sibley College and will consequently be under the supervision of this college from the time it matriculated until it graduates. Formerly the students in this course registered in the College of Arts and Sciences during the first two years. The young man who has completed the ordinary four-year high-school course, but who is not credited with the full four units of mathematics required for admission as a four-year engineering student, may now enter Sibley College in the five-year course; thus, instead of spending an additional year in a preparatory school in order to secure the mathematical training required for the four-year course, he may enter at once and obtain an additional year's work at college and thereby secure a more liberal training than is afforded by the regular course, which is limited to engineering subjects or those preparatory to such. This extra work may be distributed through the five years in such manner that, starting with elementary courses in the first year, the student may subsequently pursue in proper sequence the more advanced courses based on the preliminary ones. The extra time may be devoted to liberal or cultural subjects, to courses preparatory for the business or administrative side of engineering, to specialization in chemistry, physics or geology, or to mining or civil engineering.

KANSAS STATE AGRICULTURAL COLLEGE—The Division of Mechanic Arts has established a group of short courses in mechanic arts more or less parallel to the short courses usually given in agriculture. Courses are offered in (1) concrete construction, (2) shop work, including wood and iron working, (3) road building, irrigation and drainage, (4) steam and gas traction engines. These are open to men not less than 18 years of age, who have had a fair common-school education. Each course is ten weeks in duration, and will be offered during the winter term, beginning Jan. 5, 1915.

The college has also recently established, in its secondary school, a series of trade practice courses in [illegible]

arts. Courses are given in (1) blacksmithing, (2) carpentry, (3) concrete construction, (4) gas engines, (5) steam engines and boilers, and (6) traction engines. Persons who are 14 years of age or older, and who have completed the eighth grade of the public schools, are admitted to these courses without examination. The courses are each three years in length, and have much work in common, including English, mathematics, history, physics, drawing and beginning shopwork. The differentiation comes mostly in the second and third years, in the former of which about one-third and in the latter of which three-fifths of the time is devoted to the specialized subjects. The purpose of the courses is to teach the elements of the trades, while a general training is being given similar to that of the high school, with the foreign languages omitted.

The Department of Civil and Highway Engineering is planning to give a short course in road building, irrigation and drainage during the coming winter. The course will be of ten weeks' duration and is intended to accommodate county surveyors and county engineers, at present in practice, who desire additional technical work along lines in which they are particularly interested. Surveying, road construction, bridge and culvert construction, road laws and administration, irrigation and drainage engineering, and specifications and contracts are among the subjects which will be treated in the course.

NEWS NOTES

A 30-In. Water Main Burst in Portsmouth, Ohio, on Dec. 16. The main was located 6 ft. below the surface. The work of repairing the main began early on Dec. 17 and was completed on Dec. 20.

By Recent Annexation Richmond, Va., has added materially to its area and increased its population by some 20,000.

Typhoid Fever in Chicago has shown some increase lately, and the Health Department attributes this to pollution of the water-supply taken at the Chicago Ave. pumping station. Consumers have been advised to boil the water, and treatment with hypochlorite of lime has been instituted.

The Near-Side Stop Is a Success in New York, according to reports received by the Safety First Society, from the officials of the companies operating surface car lines. For example, the Third Ave. Ry. Co. reported a decrease of 245 accidents during September, October and November of this year over the same period in 1913. The near-side stop ordinance became effective Sept. 1.

The Water-Supply of Steamers on the Great Lakes is a serious menace to public health according to the annual report of Dr. Blue, Surgeon-General of the U. S. Public Health Service. It is pointed out that about 16,000,000 passengers are carried annually by steamers which draw their water-supply from the lake, and he recommends that this water should be treated on board the vessels before being distributed for drinking purposes.

An Automobile Speedway to be built for the Chicago Speedway Association will have a 2½-mile oval track designed for the highest possible speeds. The track will be 70 and 80 ft. wide on tangents and curves respectively, and will have a wood surface on a concrete base. Subways under the track will give access to the infield, which will be used for parking vehicles. Graham, Burnham & Co., of Chicago, are the architects.

The Smallest Central Electric Station in the country is probably that at Waldo, Wis., instead of the one in Clayton, Wis., noted in "Engineering News," Nov. 5, 1914. Five customers are supplied with 30-volt direct-current survice from a ¾-kw. generator and storage battery. The town has 325 population and is undergoing a transition from kerosene to electric lights. There is a transmission line within 4½ miles of the village and service from it is agitated.

The Gold Medal for Safety presented annually by the Travelers Insurance Co. under the direction of the American Museum of Safety to "the American employer, either an individual or a corporation, who during the year has, in the judgment of the jury of awards of the Museum, achieved the most for the safety of employees," has been awarded this year to the Commonwealth Edison Co., of Chicago. The four previous winners of the gold medal have been the United States Steel Corporation, the Pennsylvania R.R. Co., the New York Edison Co. and the New York Telephone Co.

Municipal Improvements at Quito, Ecuador, are not as yet very extensive, according to a report received from a South American correspondent. The city has about one-half mile of streets paved with Belgian blocks, 28 miles with rough cobbles and 12 miles unpaved. The city has recently entered into a contract with William Schroeter & Co., a German concern, for installing fire hydrants and for putting in sewers. The city expects to buy fire engines soon. Our correspondent states that: "Heretofore, fires have been very rare and have been extinguished by hand or allowed to burn out. The houses are separated by very thick walls (3 ft.), and there is very little in them to burn."

Motorman's Cab Signals are provided for in the new automatic signal system adopted by the New York Municipal Railway for its portion of the new subway lines to be operated in New York City. The award of the contract for this system to the General Railway Signal Co. has been approved by the Public Service Commission. The new system provides block intervals and speed control with signals in the motorman's cab: if for any reason he fails to slow down at proper signals, a track device engages car attachments automatically reducing the speed to the desired rate independent of the motorman's action. Thus the train is allowed to continue at properly reduced speed, but is not stopped completely, as at present is necessary with the use of track trips in connection with block signals. The total bid of the Signal Company for equipping all the subway and elevated lines to be operated by the Municipal Railway Corporation is about $1,413,000. The Public Service Commission is considering the issue of an order requiring the installation of such signals on the elevated lines in New York City, on which two serious accidents have occurred recently—both due to failure of the employees to perform their duties properly.

New York's Engineer Regiment Disbanded—An order by Governor Glynn of New York disbanding the 22d Regiment of Engineers, New York National Guard, was issued on Dec. 24. It reads as follows:

In accordance with the military law and to meet the requirements of the War Department, the Corps of Engineers is reorganized as follows: The regimental organization of the Corps of Engineers, known as the 22d Regiment, N. G. S. N. Y., and the battalions and companies as now constituted, except the band, are hereby disbanded. The officers serving with the same being surplus are hereby placed on the reserve list. The enlisted men will be transferred or discharged, as may be necessary to carry out this order, and will be continued in the service until so transferred or discharged.

Only 15 of the officers will be retained, it is reported, and 25% of the enlisted men will be discharged or transferred to other regiments. Major-General O'Ryan, commanding the state militia division, said: "The 22d Regiment is steeped in old infantry methods. All the officers and men capable of performing the services expected of engineers will be assigned to duty after the regiment is disbanded and the battalions reorganized." A special examining board (Colonel Van C. Lucas, chief engineer officer of the state militia, President) has been appointed to pass upon the qualifications of the officers.

PERSONALS

Mr. Milton H. Bronsdon has been reappointed Chief Engineer of Power and Lines of the Rhode Island Co., Providence, R. I. He was Chief Engineer from 1907 to 1912, and since then has been engaged in general practice in San Francisco, Calif.

Mr. Friend P. Williams, M. Am. Soc. C. E., Resident Engineer of the New York State Barge Canal, Mechanicsville, N. Y., has been apointed Division Engineer of the Western Division under State Engineer-elect Frank M. Williams, M. Am. Soc. C. E.

Prof. Charles M. Spofford, M. Am. Soc. C. E., head of the technology department of civil and sanitary engineering, Massachusetts Institute of Technology, has been appointed Expert Advisor for the City of Cambridge, Mass., in connection with some taxation problems.

Mr. J. A. Almirall, M. Am. Soc. M. E., and W. C. Adams announce that, owing to the recent death of Quimby N. Evans,

[illegible] Evans, Almirall & Co. has [illegible] Almirall & Co., Inc., has succeeded to the business of the former firm. The new company has the same personnel as the old firm, with the exception of Mr. [illegible]

[illegible] M. Am. Soc. C. E., First Resident Engineer, Middle Division, New York State Barge Canal, has been appointed Division Engineer of the Middle Division by State Engineer-elect Frank M. Williams, M. Am. Soc. C. E. [illegible] connected with the Barge Canal work for a number of years and was Division Engineer during the former administration of Mr. Williams.

[illegible] M. Am. Soc. C. E., of [illegible] N. Y., a brother of Mr. Frank M. Williams, M. Am. Soc. C. E., State Engineer-elect of New York, has been appointed Division Engineer of the Eastern Division of the New York State Canals [illegible] M. Am. Soc. C. E. [illegible] Division Engineer under the former administration of his brother as State Engineer.

[illegible] M. Am. Soc. C. E., of Cornwall, N. Y., has been appointed [illegible] of the New York State Barge Canal at a salary of $[illegible] per annum, to succeed Mr. [illegible] M. Am. Soc. C. E. Mr. [illegible] graduated from Cornell University in [illegible] and began his engineering experience as a [illegible] with the Newport News Shipbuilding & Drydock Co., Newport News, Va. From 1[illegible] to 1911 he was with the New York State Highway Department. [illegible] and since then he has been in private practice.

[illegible]

Mr. [illegible] M. Am. Soc. C. E., whose appointment as [illegible] was briefly noted in our issue of last week, was born in Chicago in 1876. He graduated from Notre Dame University [illegible] in 18[illegible] and received [illegible] For [illegible] years he was in the service of the City of Chicago, Ill., as Assistant Engineer and [illegible] For the past six years Mr. [illegible] has been in private practice [illegible] Chicago.

OBITUARY

[illegible]

[illegible] in New York City, [illegible] at Virginia City, Nev. [illegible]

[illegible] tives and mining machinery. In 187[illegible] he was engaged as Consulting Engineer on the famous Sutro Tunnel in Nevada. Later he was employed by the U. S. Geological Survey to report on the mechanical appliances of the Comstock Lode, at Virginia City, Nev. For the past 3[illegible] years he was a Consulting Engineer with offices in San Francisco.

ENGINEERING SOCIETIES

COMING MEETINGS

SOCIETY OF CONSTRUCTORS OF FEDERAL BUILDINGS.
Jan. 4-6. Convention at Washington, D. C. Secy., T. R. Maul, 121[illegible] Westminster Ave., Philadelphia, Penn.

ASSOCIATION OF GOVERNMENT CONTRACTORS.
Jan. [illegible] Annual meeting at Washington, D. C. Secy., [illegible] Blair, Montgomery, Ala.

AMERICAN SOCIETY OF ENGINEERING CONTRACTORS.
Jan. 1[illegible] Annual meeting at New York City. Secy., J. R. Wemlinger, 11 Broadway, New York City.

AMERICAN WOOD PRESERVERS' ASSOCIATION.
Jan. 19-21. Convention at Chicago, Ill. Secy., F. J. Angier, Mt. Royal Station, B. & O. R.R., Baltimore, Md.

AMERICAN SOCIETY OF CIVIL ENGINEERS.
Jan. [illegible] Annual meeting in New York. Secy., Charles Warren Hunt, 220 W. 57th St., New York City.

AMERICAN SOCIETY OF HEATING & VENTILATING ENGINEERS.
Jan. [illegible]-22. Annual meeting at New York City. Secy., J. J. Blackmore, 29 W. 39th St., New York City.

INDIANA ENGINEERING SOCIETY.
Jan. 21-2[illegible] Annual meeting at Indianapolis. Secy., Charles Brossmann, 1[illegible] Merchants Bank Building, Indianapolis, Ind.

ILLINOIS SOCIETY OF ENGINEERS AND SURVEYORS.
January 27-2[illegible] Annual meeting at Springfield, Ill. Secy., E. E. R. Tratman, 1[illegible] Monadnock Block, Chicago.

AMERICAN CONCRETE INSTITUTE.
Feb. [illegible]-12. Convention at Chicago, Ill. Secy., E. E. Krauss, Harrison Bldg., Philadelphia, Penn.

AMERICAN CONCRETE PIPE ASSOCIATION.
Feb. 1[illegible]-16. Annual convention at Chicago. Secy., E. S. Hanson, [illegible] South Clark St., Chicago, Ill.

IOWA ENGINEERING SOCIETY.
Feb. 1[illegible]-1[illegible] Annual meeting at Iowa City. Secy., [illegible] Woodward, Iowa City, Iowa.

Cornell Society of Civil Engineers—The annual banquet and reunion in New York City will be held [illegible]

American Public Health Association—It has been decided to hold the next meeting of the Association [illegible] N. Y., probably in September, 191[illegible]

Missouri Highway Engineers' Association—At the annual meeting of the Association, held in Jefferson City, Mo., [illegible] the following officers were elected: President, [illegible]; Secretary, E. W. [illegible] The meeting next year will be held at [illegible]

National Lime Manufacturers' Association—The annual meeting will be held in Washington, D. C., [illegible] the object of the meeting is [illegible] to [illegible] the Treasury Department [illegible] The secretary is [illegible] Chicago, Ill.

American Institute of Consulting Engineers—The annual meeting of the Institute will be held [illegible] New York City [illegible]

Engineers' Club of Trenton—[illegible]

Youngstown Engineers' Club—[illegible]

Prices of Engineering Materials

PRICE CHANGES AND THE BUSINESS OUTLOOK

Improvement in general business and contracting is confined to a few localities while from many quarters come authentic reports that business is more unsatisfactory than at any corresponding time in several years. Building activity is less, iron production smaller, consumption of metals not so large as a year ago, fewer men are employed, and fewer freight cars are in use. Against these unfavorable factors is that knowledge that there is more State and municipal work in progress than a year ago and that a plethora of idle funds awaits employment. Prospects for excellent business later are particularly bright when viewed from the agricultural side. Never has there been such an excellent outlook for wheat. Other crops will be large and farmers are undoubtedly more prosperous than ever before. The prosperity of the farmer is a good foundation upon which to build an active business season for all kinds of trade.

The inability of a dry-goods distributing house of international reputation to meet its obligations is of deep significance. Mindful of the fact that New York has ceased to be a dry-goods jobbing center, and perhaps that kind of business will have to make way for more modern methods, this failure indicates clearly that merchants scattered in the smaller towns in the West and the Southwest have been unable to make collections with sufficient regularity to pay the wholesaler. That it did not have a more serious effect is a strong testimonial to the stability of business.

It should be distinctly understood that present conditions are the result of commercial ad not financial ills. The abundance of funds is recognized in almost every section of the country, and exports of gold although frequent have caused no disturbance in monitary conditions. The trouble is clearly a lack of business.

Contract work has improved. This applies almost wholly to municipal, county and state work, and the reason for it is not hard to find. For the last two or three years municipalities have been unable to sell their bonds at anything like a satisfactory rate, and now funds are plentiful, work has been started. Then, too, there has been a more or less general awakening of civic pride in many of the older cities through the country. Albany, N. Y., may be pointed to as an example of this. Moreover, in some cities at least an effort has been made to advance construction work this year so that employment could be given to many who would otherwise be idle.

Prices in important lines continues to decline steadily. A quotation of \$1.05 Pittsbugrh, for plates has been recorded. The index figures issued by the government show a lowering in the cost of living and even a well known maker of motor cars cut the price of this luxury \$200.

The unfavorable conditions in the iron trade are attracting more attention than in any other line. Production continues to decline, unfilled orders of the United States Steel Corporation are less and less each month, and prices in every line are the lowest in years and while stocks continue to accumulate. Contracts for the cast-iron segments for the East River tubes call for about 80,000 tons which went at an unusually low price, something under \$27 a ton, or a price close to the figures which were made for the Hudson tube at the time of severe business depression.

Labor is easy to obtain; in fact, there is no difficulty in obtaining any number of workers for outside construction at \$1.50 a day for ordinary work. Immigration figures also tell a story. For the first five months of the year the number of steerage passengers coming into the country was 180,000 less than during the corresponding time last year.

Cement manufacturers are maintaining a price which is equivalent to about 90c. per bbl. in bulk at the mill. The mills are working to about 50 per cent. of their capacity.

Prices of metals continue to decline. Copper is below 14c., and tin is sold around the lowest prices reached in the last three years. Stocks of copper are accumulating; the same is true of tin.

The decline in crude oil has not been so spectacular as it was two months ago, but ther has been much competition and in the East some particularly low prices have been named to the retail trade. Some garages sell gasoline as low as 9c. per gallon.

LABOR

Contractors can get all the men they want for \$1.65 a day, and in many places \$1.50. Most laborers on state road work are paid \$1.50 for grading and \$1.65 for quarry work. Enforced vacations are the rule in a number of lines. Many of the leading railways have reduced forces 10% by compelling all employees from the president down to take a three-days' vacation each month. The Ford plant is granting a month's vacation, without pay, and this has been extended to a number of other factories. Skilled labor is in somewhat better demand, but there is a drastic weeding out of inefficient help in all quarters. The Westinghouse strike in Pittsburgh is the most serious labor disturbance reported this month. It seems unlikely that there will be any compromise to the Union as such. Business in the electrical line has shown a distinct falling off.

Imigration statistics for the first five months of the year indicate clearly that there is less incentive for contract laborers to come to this country. For this fiscal year to June 12 and incoming steerage passengers numbered 437,000 compared with 620,000 in the corresponding period last year. This was a falling off of 183,000. At the same time the steerage passengers leaving this country in 1914 numbered 229,000 compared with 159,000 at the same time last year, showing more departures by 70,000 this year than last, and making a difference of 250,000 in the number of laborers of this class.

CRUSHED STONE, SAND AND GRAVEL

Crushed Stone—Sellers of crushed stone in the New York market are of unanimous opinion that business has not been so unsatisfactory in a number of years. Indeed when the capacity of the stone-crushing plants is taken into consideration it is difficult to find a time when there was so little business ruling. Some more business has been placed in June than in May, but only a little more and it is doubtful if for the first six months of the year there has been 50% as much stone delivered in New York as there was last year in the same time. Prices are steady at 90c. to \$1 for 1½-in. stone, and 95c. to \$1.10 for ¾-in. stone. These quotations are for full cargo lots of 500 cu.yd. delivered alongside of dock New York or Brooklyn.

Sand and Gravel—Business is very light. There is practically no demand for gravel except subway gravel and little sand is moving. Gravel sells at 90c. for 1½ in., while special gravel for subway specifications is quoted at \$1.15.

Sand sells at 50c. per cu.yd.

The above quotations are for full cargo lots of 500 cu.yd. delivered alongside of dock, New York. In Boston gravel sells at 35c. per cu.yd. at quarry 25 mi. out, the freight rate to Boston being 40c.

CEMENT, LIME AND BRICK

Portland Cement—The most surprising thing in the cement trade is that prices have been maintained. There is of course, some cutting, but there always is at such a period when the smaller mills are out for business. In some cases the cut has amounted to more than 10c. per bbl., but in general prices are firm. Most of the business now being placed is for road work in various states. The leading manufacturers of cement in the Lehigh Valley district are maintaining their position with a great deal of stubbornness and refusing to make concessions of any kind, this in spite of the fact that they do not seem to be running more than 50% of capacity. In the West business is slightly better, but not as good as it was hoped early in the year.

Quotations are unchanged at \$1.58 per bbl. for delivery within lighterage limits New York. This is equivalent to \$1.46 in Jersey City and 95c. per bbl. in bulk at the mill. Quotations given below do not include the allowance of 40c. for baks returned. They are as follows per bbl. f.o.b. the points named, not including package:

Boston	\$1.32	Chicago	\$1.15
Cleveland	1.30	Detroit	1.19
Duluth	1.38	Jersey City	1.06
Minneapolis	1.35	New York	1.18
Pittsburgh	1.10	St. Paul	1.35

Brick—Within the last week there has been improvement in the business situation and brick are in much better demand. Prices are steady at \$5.75 per M. in New York. From yards in Newark, \$7.25 is demanded.

Lime—Business is quiet, but prices are unchanged at 97c. per bbl. for state common, 200 lb. net; \$1.37 for 300 lb. "Star"; \$1.55 for 300 lb. finishing; \$1.10 for 200 lb. finishing and \$1.72 for 350 lb.

Plaster Blocks—Prices are without change, and the market is fairly active, quotations being as follows:

	Weight, per sq.ft., lb.	Price, per sq.ft., cents
2-in.	7	6
3-in.	8½	6½
4-in.	11	7¼

These blocks are made 32 in. long by 13½ in. wide, containing 3 sq.ft. of surface. The 2-in. blocks are solid, but the others are hollow.

IRON AND STEEL

Pig Iron—Sales of pig iron have been limited, and prices have declined to still lower levels, though stocks do not seem to be accumulating. The Southern iron market has been of more interest than anything else, and some sales in Birmingham have been made as low as \$10. The general market there, however, may be quoted at \$10.25@10.50. In the North there has been very little new buying. The chief feature of interest was 80,000 tons of tunnel segment for the two East River tubes in New York, and although no quotations or authentic figures have been given out, it was understood that the price was below \$27 per ton for castings delivered in New York, machined, and ready to be placed. This is an unusually low quotation, and almost duplicates the low figure at which the Hudson Tunnel segments were placed a number of years ago, when labor and materials were quoted at less than they are today. The unfilled orders of the United States Steel Corporation continue to decline, and on May 31 were slightly less than 4,00,000 tons.

Quotations for lots of 100 tons or over, and the prices named, are as follows: Cincinnati Southern Foundry No. 2, \$13.50@14; Northern Foundry No. 2, \$14.75@15.25; Northern Foundry No. 3, \$14.50@14.75; in New York, Northern Foundry No. 1, \$14.75@15; Northern Foundry No. 2X, \$14.50@14.75; and Southern Foundry No. 2, \$14.75@15; in Chicago, Northern Foundry No. 2, \$13.75@14.25, and Northern Foundry No. 3, \$13.50@14. In Pittsburgh, besemer is \$14.90 and basic \$13.90. These quotations include the 90c. freight rate from the valley to Pittsburgh. In Birmingham, Southern Foundry No. 2 is quoted at \$10.25@10.50, but there some few sales were made as low as \$10.

Freight Rates—The freight rates on finished-steel products from the Pittsburgh District, including plates, structural shapes, merchant steel and iron bars, pipe fittings, plain and galvanized wire, nails, rivets, spikes and bolts (in kegs) black sheets (except planished), chain, etc., are as follows, in cents per 100 lb.: Albany, 16; Buffalo, 11; Boston, 18; Baltimore, 14½; Canandaigua, 13½; Cleveland, 10; Columbus, 12; Cincinnati, 15; Chicago, 18; Denver, Colo., 85½; Harrisburg, 14½; Louisville, 18; New York, 16; Norfolk, 20; Philadelphia, 15; Rochester, 11½; Richmond, 20; Scranton, 15; St. Louis, 23; Washington, 14½.

Steel Shapes—Some lines show an improvement but business is still dull. Large consumers are more willing to buy in carload lots for they feel the bottom has been reached and this reduces the volume of business that the jobber has. From warehouse New York prices are as follows:

	Cents Per lb.
Refined iron.	
1 to 1⅞ in., round and square	1.80
1½ to 4 in. x ⅜ to 1 in.	1.80
1½ to 4 in. x ¼ to $\frac{5}{16}$ in.	2.00
Norway bars	3.20
Burdens bar iron	3.15
Soft steel:	
¾ to 3 in., round and square	1.80
1 to 6 in. x ⅜ to 1 in.	1.80
1 to 6 in. x ¼ and $\frac{5}{16}$ in.	1.95
Rods—⅝ and $\frac{11}{16}$ in.	1.90
Bands—1½ to 6x$\frac{3}{16}$ in. to No. 8	2.10
Beams and channels—3 to 15 in.	1.85
Angles:	
3 in. x ¼ in. and larger	1.85
3 in. x $\frac{3}{16}$ in. and ⅛ in.	2.30
1½ to 2½ in. x ⅛ in.	2.05
1½ to 2¾ in. x $\frac{3}{16}$ in. and thicker	1.95
1 to 1¼ in. x $\frac{3}{16}$ in.	2.05
1 to 1¼ in. x ⅛ in.	2.10
1½ to 2½ x ¼ in.	2.00
1½ to 2½ x $\frac{3}{16}$ in.	2.10
3 in. and larger	1.90

Spiral Riveted Pipe—Prices are without change. The following quotations are f.o.b. factory, freight equalized with New York, being figured at a discount of 50, 10 and 10% from list. These are for orders amounting to approximately $250. For large orders, prices are cheaper by 12½ to 20%.

Diameter in in.	*Thickness Birmingham wire gage	Net price per 100 ft. With bolted joints complete: Plain	Asphalted	Galvanized
4	18	$19.76	$21.48	$30.74
5	18	23.40	23.70	37.14
6	16	33.05	35.76	49.73

28	10	301.32	314.89	395.37
30	10	324.81	399.15	430.64

*Made in both lighter and heavier gages at corresponding differences in price.

Chain—Prices are steady and without change, as follows. These prices are per 100 lb., f.o.b. Pittsburgh:

$\frac{3}{16}$ in.	$7.50	½ and $\frac{9}{16}$ in.	3.00
¼ in.	4.95	⅝ and $\frac{11}{16}$ in.	2.90
$\frac{5}{16}$ in.	3.95	¾ and $\frac{13}{16}$ in.	2.80
⅜ in.	3.40	⅞ and $\frac{15}{16}$ in.	2.70
$\frac{7}{16}$ in.	3.20	1 to 1¼ in.	2.60

EXTRAS TO ABOVE LIST PER 100 POUNDS

	For BB	For BBB
$\frac{3}{16}$-in. and ¼-in.	$1.50	$2.00
$\frac{5}{16}$-in. and larger	1.25	1.75

Switch Points—The following prices are named f.o.b. mill, for switch points in lots of ten or more pairs: for 60-lb. rail. 10-ft. points, $16.25; 15-ft. points, $17.50; for 70-lb. rail, 10-ft. points, $18; 15-ft. points, $25; for 80-lb. rail, 10-ft. points, $25.50; 15-ft. points, $27.75; for 90-lb. rail, $33.50. All of the above are furnished with three rods, except the 10-ft. points for 60- or 70-lb. rail, which have only two.

Nails—Wire mills are operating at about 50% of capacity. The base quotation in Pittsburgh is $1.50 to $1.55 per keg of 100 lb. In New York wire nails from store are $1.95 to $2, and in Chicago nails are $1.88 to $2.95.

Wire—The mills are operating to 50% of capacity, but this is the dull season. Prices are as follows: Plain barbed wire, $1.35; painted barbed wire to jobbers in carload lots, $1.55; to retailers in carloads, $1.65; galvanized barbed wire, $1.95. These quotations are f.o.b. Pittsburgh. In Chicago plain wire is $1.55, painted barbed wire $1.78, and galvanized barbed wire $2.10. All of these prices are per 100 lb.

REINFORCING MATERIALS

Triangle Mesh—Business is not especially active. Quotations are without change as follows:

PRICE PER 100 SQ.FT.

Style No.	Cross sec. area per ft. width	Plain material: Carload lots	Plain material: Less than car lots and over 10,000 sq.ft.	Galvanized: Carload lots	Galvanized: Less than car lots and over 10,000 sq.ft.

*This material is made in regular widths of 18, 22, 26, 30, 34, 42, 46, 50, 54 and 58 in. Standard lengths in rolls are 150, 250, 300 and 600 ft.

Bars, Concrete Reinforcing—In some quarters there has been competition which forced prices below the 1.15c. price but in most cases that has been the bottom figure. Business is better than a month ago.

Quotations are as follows:

Size	Cents per pound: Mill shipments Pittsburgh	Warehouse Pittsburgh	Delivered from warehouse New York
¾-in. and larger	1.15	1.65	2.25
⅝-in.	1.20	1.65	2.30
½-in.	1.35	1.95	2.30
⅜-in.	1.45	2.05	2.45
¼-in.	1.75	2.30	2.75

METALS

Copper—Prices have declined almost continuously throughout the month and very little business has been done. It is true that around the 14c. level there was some buying, but this was only in small lots, and consumers have taken no more than an academic interest in the market. For foreign accounts business has been light. The chief trouble with the trade in finished material is, while a fair business is ruling, there is on incentive to do it, because there is no profit. Prices at the end of the month were barely steady at 13.62½c. delivered in 30 days.

Tin—A fair business has been transacted, but it has been spotty—one week good and another week extremely poor. The statistical position of tin would seem to warrant somewhat higher quotations, but a powerful clique is operating in the foreign market and has thus far been successful in keeping prices down. Stocks are good and deliveries during June were about 4000 tons.

Lead—Some of the largest sellers of lead had a most satisfactory business during May; others reported little activity. Prices are undeniably low and there seems to be little doubt that the low quotations has induced some business. In New York lead can be had at 3.90c, and in St. Louis at 3.75c.

Spelter—The market is exceedingly dull and prices are unremunerative to the producer. In fact, producers are in a bad way. Spelter is selling at about 5.05c. New York and 4.95c. St. Louis.

Miscellaneous Metals—All kinds of old metals are in fair demand, but prices are low, and it is sometimes possible to shade even the quotations given below, which are for small lots:

Bismuth	$2.25
Brass tubes, iron-pipe sizes:	
½-in.	.17
¾- to 3-in.	.16
3½-in.	.16
4-in.	.17
Brass rods	.15¼
Brass sheets	.15½
Solder, half and half guaranteed	.21
Zinc sheets	.08½
Manganese bronze rods	.23½
Copper sheets, base	.19
Pig tin (five-ton lots, cash)	.31

Old Metals—Prices are lower and there is very little demand. The following quotations are for small lots delivered to buyer's warehouse:

	Cents
Copper, heavy and crucible	12.00
Copper, heavy and wire	11.75
Copper, light and bottoms	10.25
Brass, heavy	7.75
Brass, light	6.25
Heavy machine composition	10.50
Composition turnings	9.00
Lead, heavy	3.40
Lead, tea	3.15
Zinc scrap	3.50

MILL SUPPLIES

Belting—There is [illegible] business, but prices seem fairly well [illegible]. The [illegible] on rubber belting are as follows: [illegible] 40 and 10 and 10% [illegible] competitive, [illegible] and 1[illegible]. Leather belting can be had as follows: Extra heavy, [illegible]; heavy, [illegible] and 10 and [illegible]; medium, [illegible].

At the [illegible] discounts, the net prices per foot of leather belting are as follows:

LEATHER BELTING PRICES IN CENTS PER FOOT

Size Inches	Extra Heavy	Heavy	Medium
1	11 [illegible]	10 10	7 20
1½	1[illegible]	1[illegible] 20	10 80
2	[illegible] 75	21 [illegible]	14 40

30	3 1[illegible]	3 10	2 17
36	4 10	3 70	2 60

Chain Belting—Prices continue unchanged. Quotations are as follows: From 3 hp. to 10 hp., 30-in. centers complete with two sprockets, $7@8 per horsepower. From 10 hp. to 25 hp., 36-in. centers complete, $5@6 per horsepower. For 25 hp. to 1[illegible] hp., 56-in. centers complete, $4@5 per horsepower. From 1[illegible] hp. to 500 hp., 72-in. centers complete, $3@4 per horsepower.

CLAY PRODUCTS

Sewer Pipe—Business continues unusually quiet and the drastic cut of last month failed to bring orders. Prices are not as low as last month, the discount for the smaller sizes being 7[illegible]% from list instead of 75%. Revised discounts are as follows: [illegible] to 24-in., 7[illegible]%; 27- and 30-in., 67[illegible]%; 33- and 36-in., 62[illegible]%.

At these discounts the net prices per foot in New York are as follows:

SEWER PIPE PER FOOT

Size	Delivered N. Y.	Size	Delivered N. Y.
3 in.	$0 [illegible]5	18 in.	$0 418
4 in.	0 [illegible]5	20 in.	0 495
5 in.	0 [illegible]	22 in.	0 66
6 in.	0 0[illegible]	24 in.	0 715
8 in.	0 121	27 in.	1 49
10 in.	0 121	30 in.	1 82
12 in.	0 [illegible]	33 in.	2 38
15 in.	0 2[illegible]7	36 in.	2 67

Flue Linings—The [illegible] last month evidently was not drastic enough and [illegible] have again been revised. The new discount is 41% from list. At this discount the net prices per foot, New York delivery are as follows:

	Weight in lb.	Price per ft.		Weight in lb.	Price per ft.
4½x13-in.	14	$0 067	8½x13-in.	28	$0 124
[illegible] in.	2[illegible]	0 [illegible]	8½x18-in.	45	0 1[illegible]
[illegible] in.	10	0 19	13x13-in.	38	0 167
7½x7½ in.	15	0 076	13x18 in.	57	0 2[illegible]
8½x8½-in.	19	0 [illegible]	18x18 in.	75	0 [illegible]

Hollow Tile—Prices are steady and unchanged as follows, f.o.b. Perth Amboy:

Size	Price per block: Hollow wall tile	Size	Price per block: Interior partition block
4x12x12-in.	$0 06	2x12x12-in.	$0 048
6x12x12-in.	0 0[illegible]	3x12x12-in.	0 048
8x12x12-in.	0 1[illegible]	4x12x12-in.	0 053
10x12x12-in.	0 13	6x12x12-in.	0 072
12x12x12-in.	0 15	8x12x12-in.	0 094

OILS AND PAINTS

Petroleum Products—A number of new producers in the Los Angeles district have begun to ship oil. The market for [illegible] products is [illegible] as [illegible] earlier in the year and [illegible]. [illegible] Pennsylvania, second sand [illegible] [illegible] black and New Castle is [illegible]. [illegible] and Oklahoma are [illegible] at [illegible]. California oils are quoted as follows: [illegible] gravity, [illegible] gravity, 5[illegible]; [illegible] gravity, [illegible] gravity, [illegible].

[illegible] products are cheaper. [illegible] is quoted at [illegible] in steel barrels. Some very low retail [illegible] have been established in northern New Jersey and as [illegible] per gal. has been quoted. Petroleum is still quoted at [illegible].

Linseed Oil—Prices are slightly higher at [illegible] to [illegible] for [illegible] and [illegible] for [illegible] of town raw. Flaxseed in [illegible] is [illegible] higher than last month at $1.[illegible] per bu.

Spirits Turpentine—Business is light and prices are steady. [illegible] New York spirits are quoted at [illegible] and in Savannah at [illegible].

Carbolineum—This preservative is sold in lots of one or [illegible] at [illegible] per gal., f.o.b. New York. In half barrels of [illegible] and [illegible] gal. at [illegible] per gal., f.o.b. New York.

Paints—Prices are steady in New York as follows: White lead in oil in 100-, 200- and 500-lb. kegs is 7¼@7½c. per lb., in 25- and 50-lb. kegs, 7¾c. per lb. Red lead and litharge in 100-lb. kegs is 7@7½c. per lb.

Hydrex preservative paint is 75c. per gal. in bbl. lots, New York, N. Y.

Colors in oil are quoted at the following prices per lb.: Lamp black, 12@14c.; Chinese blue, [illegible]; Prussian blue, 32@36c.; Van Dyke brown, 11@14c.; Chrome green, 12@16c.; raw or burnt Sienna, 12@15c.; raw or burnt Umber, 11@14c.

LUMBER

While the lumber trade has been generally depressed, stocks are low and prices have appeared to be near bottom.

Spruce—In Boston spruce is selling at $23.50 to $24 base, and quotations for frames are as follows: 8 in., $23.50 to $24; 9 in., $24.50 to $25; 10 in., $25.50 to $26; 11 and 12 in., $26.50 to $27.

Hemlock—Prices show no changes and the base quotation New York is $22.50. In Boston hemlock is selling at $22, but the cheapness of other lumber makes it difficult to sell at this quotation.

White Pine—The Boston market is dull. Up to 2 in. sells at $100 to $101, 2½ and 3 in., $110; 4 in., $120. Common sells at $73 to $78 for 1 to 2 in.

Railway Ties—Business is exceedingly dull. Some very tempting quotations have been made, but without success. The market is dull and prices are as follows: for 7x9-in. by 8-ft. 6-in., 80c.; 6x8-in. by 8-ft., 70c.; 6x9-in. by 8-ft., 78c. These are f.o.b. New York.

MISCELLANEOUS

Explosives—Dynamite of the kind generally used by contractors is approximately 11@13c. per lb., f.o.b. factory, in ton lots. Blasting powder, classified as "soda" grade, is sold at $1.20@1.40 per keg of 25 lb. in lots of 10,000 lb.

Exploders, per hundred, are sold at the following prices: 4 ft., $3.60; 6 ft., $4.10; 8 ft., $4.60; 10 ft., $5.10; 12 ft., $5.60; 16 ft., $6.60; 20 ft., $7.50; 25 ft., $9.40; 30 ft., $12; 36 ft., $14.60.

Caps in lots of 10,000 are $7@8 per thousand.

Blasting machines for 10 holes are $12; 25 holes, $20; 50 holes, $40; 100 holes, $60.

Telegraph Wire—The demand for telegraph wire has been fair. For lots of fair size, the wire measured in Birmingham wire gage, prices are as follows: "Extra Best," Nos. 6 to 9, 4⅜c.; Nos. 10 and 11, 4½c.; No. 12, 4⅝c.; No. 14, 5¼c. "Best Best," Nos. 6 to 9, 3½c.; Nos. 10 and 11, 3⅝c.; No. 12, 3¾c.; No. 14, 4c. Actual freight is allowed from Trenton, N. J., where it does not exceed 25c. per 100 lb.

Lighterage Limits—The free delivery or "Lighterage Limits" in New York City are as follows: In Manhattan, from a point opposite the Fort Lee ferry, south along the Hudson River around the Battery and north along the East and Harlem Rivers to the Jerome Ave. Bridge at 155th St. In New Jersey, south from Fort Lee ferry to Bayonne City points on the north and east shores of Staten Island between Bridge Creek (Arlington) and Clifton, both inclusive, and including Elm Park, Erastina and Shooters Island. In Brooklyn, from 69th St., Bay Ridge, north to Pot Cove, Astoria, Long Island City.

Asbestos—Asbestos building felt and sheathing in less than ton lots is 3½c. per lb. for the light, weighing from 6 to 30 lb. per 100 sq.ft. [illegible] per lb. is charged for the heavy, weighing from 45 to 66 lb. per sq.ft.

Millboard is made in standard sheets 40x40 in. and 41x[illegible] from 3 to 37 lb. per sheet. The net price in 100-lb. lots is [illegible] per lb.

Asbestos wood, used for fireproofing, ventilators and smoke jacks, comes in sheets 36x[illegible] in., 42x[illegible] in. and 42x96 in. The prices per sheet, f.o.b. factory, in New England, are as follows:

Thickness	Weight, pounds	Price	Thickness	Weight, pounds	Price
1/16-in.	1	$0 [illegible]	[illegible] in.	5	$0 [illegible]
3/32-in.	1½	0 12	[illegible] in.	6	0 [illegible]
⅛-in.	2	0 14	[illegible] in.	7	0 [illegible]
5/32-in.	2½	0 [illegible]	1 in.	9	0 [illegible]
3/16-in.	3	0 [illegible]	1¼ in.	10	0 [illegible]
7/32-in.	3½	0 29	1½ in.	12	0 61
¼ in.	4	0 31	1¾ in.	14	0 [illegible]
5/16 in.	4½	0 34	2 in.	16	0 [illegible]

Asbestos sheathing, corrugated, sells at 15c. per sq.ft. f.o.b. mill eastern Pennsylvania.

Rubber—Prices continue to decline and stocks are increasing. Up River Para fine can now be had at [illegible] per lb. compared with [illegible] a year ago and $1.12 two years ago. Up River Para coarse is [illegible]. Caucho balls are 3[illegible]. African rubbers are no cheaper and [illegible] is noted. Scrap rubber is slightly lower as follows: Automobile tires [illegible] to 5[illegible]; bicycle tires 3¼@3[illegible]; air brake hose 2¼ to 3[illegible] and inner tubes 14 to 17[illegible].

The Peebles Paving Brick Co., which has two plants at Portsmouth, [illegible], has purchased a plant at Firebrick, Ky., and will manufacture the Dunn brand of Wire-Cut-Lug Brick.

The Philadelphia office of the Mack Manufacturing Co. is now located in the Lincoln Bldg., directly opposite the City Hall. This office is in charge of R. T. Hutchins.

The France Engineering Co., Second National Bank Bldg., Toledo, O., has been organized by George L. Kirby, Willis R. France and Isaac Hartman to conduct a general engineering practice. The company would like to receive catalogs bearing on construction work.

RAILWAYS

✚Florida—Tampa & Gulf Coast Ry.—This company has awarded the contract for construction of its proposed line from Belleair, Fla., to St. Petersburg. C. H. Lutz, Odessa, Fla., is Gen. Mgr.

Alabama—Alabama Great Southern R.R.—This company, it is reported, will ask for bids in about two weeks for double-tracking two sections of its line. The first work will be between Birmingham, Ala., and Mobile Junction, Ala., 14 miles, and between York, Ala., and Meridian, Miss. This is part of the plan to double-track the entire line from Chattanooga, Tenn., to Meridian, Miss., for which $25,000,000 in bonds have been issued. C. Dougherty, Cincinnati, Ohio, is Ch. Engr. Noted June 25.

Mississippi—Alabama Great Southern R.R.—See item under Alabama.

✚Mississippi—The Commercial Club of Yazoo City, Miss., has awarded the contract to WALTER C. MURPHY, Yazoo City, for the construction of a standard gage railroad from Yazoo City to Carthage, Miss. Bonds for $100,000 have been issued.

Mississippi—Mobile & Ohio R.R.—This company plans to double-track its line between Corinth, Miss., and Jackson, Tenn. B. A. Wood, Mobile, Ala., is Ch. Engr.

✚Louisiana—Vicksburg, Alexandria & Southern Ry.—This company has awarded a contract to FRANK T. CONSTANT, Alexandria, La., to construct 8½ miles of its proposed line, from Tioga, La., to Alexandria.

Tennessee—Mobile & Ohio R.R.—See item under Mississippi.

Tennessee—Belt Ry. of Chattanooga—This company, it is reported, has purchased 50 acres of land about two miles north of Chattanooga, Tenn. Terminals and yards will be constructed. H. S. Chamberlain, Chattanooga, is Pres.

Tennessee—Nashville, Shiloh & Corinth Ry.—The citizens of Perry County, Tenn., will vote July 11, on the proposition to issue $100,000 in bonds to aid the construction of this company's proposed line. The county seat of Perry County is Linden.

Tennessee—Alabama Great Southern R.R.—See item under Alabama.

Kentucky—Wasioto & Black Mountain R.R.—This company plans to construct an extension from Benham, Harlan County, Ky., to coal and timber lands in Letcher County, 16 miles.

Kentucky—Illinois Central R.R.—This company plans to start work soon to double-track its line from Princeton to Eddyville, 40 miles, at an estimated cost of $500,000. A. S. Baldwin, Chicago, Ill., is Ch. Engr.

Ohio—Tri-State Rys. Co.—See item under Michigan.

Ohio—Akron, Canton & Youngstown Ry.—This company plans to construct an extension to Canton, Ohio, from its present terminus at Magadore, Ohio. Estimated cost $3,000,000. J. A. Donahey, Akron, Ohio, is Gen. Supt. and Ch. Engr.

✚Michigan—Tri-State Rys. Co.—This company has awarded the contract to A. C. LINGEBACH & CO., Chicago, Ill., for constructing its proposed 18-mile railroad from Hillsdale, Mich., south to Pioneer, Ohio. Noted June 25.

Illinois—La Salle Terminal R.R.—This company is having surveys made for its proposed seven-mile industrial line in the La Salle District, Ill. Isham, Randolph & Co., Chicago, Ill., are Engrs.

Wisconsin—Wisconsin Southern Ry.—This company is receiving bids for the construction of 32 miles of railroad in Wisconsin. The officials of the company are located at Fond du Lac, Wis.

Nebraska—Missouri Pacific R.R.—This company, it is reported, plans to rebuild its low-grade line between Omaha, Neb., and Kansas City, Mo. J. R. Stephens, St. Louis, Mo., is Ch. Engr.

Missouri—Rolla, Ozark & Southern R.R.—This company was granted a charter, June 11, to construct a railroad out of Rolla. J. J. Cope, Salem, Mo., is interested.

Arkansas—The construction of a railroad from Hot Springs, Ark., to Mena, Ark., 65 miles, is under consideration. W. E. Womble, Womble, Ark., is interested.

Arkansas—Free Valley R.R.—This company has been granted a charter by the State Board of Railway Incorporation, Little Rock, to construct a railroad from Eagle Mills, Ark., to Princeton, Ark., 25 miles. Edward Bower, Little Rock, is interested.

Texas—Kansas City, Mexico & Orient Ry.—This company plans to construct a line from Alpine, Tex., to the Rio Grande crossing, six miles from Presidio, Tex. R. P. Parker, San Angelo, Tex., is Ch. Engr.

Texas—The Chamber of Commerce of Dallas, Tex., it is reported, is considering the construction of a railroad from Dallas to Palestine, Tex., 105 miles. J. R. Babcock, Dallas, is interested.

Idaho—Oregon Short Line R.R.—This company plans to construct a line from the Yellowstone Park Branch into Teton Basins, Idaho, a distance of 75 miles. E. E. Calvin, Salt Lake City, Utah, is Gen. Mgr.

Nevada—A merger by which two parallel lines of railroad in Nevada are to be made one, and trackage abandoned whose initial cost was $1,200,000, was decided upon at a conference in this city June 17, between the officials of the Las Vegas & Tonopah R.R. and Tonopah & Tidewater R.R., which was the Bullfrog Goldfield R.R. The two roads were built when the Goldfield-Tonopah District was prospering, but when the mines began to show disintegration it was found that one line was not needed. As mapped out, about half of the roads between Goldfield and Beaty will be abandoned, and the remaining segments hooked together. J. Ross Clark, Los Angeles, Calif., is Pres. L. V. & T. Ry.

California—John Thorp, Memphis, Tenn., and Y. S. Scritsmier, Portland, Ore., are interested in the construction of a railroad from Sacramento, Calif., to timber lands in Eldorado County, Calif.

★Canada—A Canadian holding company owns the charter for a continuous line of railway in western Canada, covering a distance of approximately 1250 miles. The line traverses a territory containing coal, timber, oil and various kinds of minerals and also a most productive wheat country. The company has made reconnaissance, route and location surveys costing about $150,000, and has also made accurate estimates of the cost of construction. Bonding powers and government grants considerably exceeding the estimated cost of construction are granted to the company by acts of Canadian Parliament. The holding company owns several valuable tracts of coal, oil and timber lands and also a number of valuable terminal sites, situated in leading commercial centers. The company wishes to place the whole proposed line under construction immediately and is prepared to treat with capitalists or large contractors who will take the construction bonds at an agreed price and build and equip the said proposed lines according to the plans prepared by the company's engineers. Offers will only be entertained from capitalists or contractors of known standing. Correspondents are therefore required to give full particulars of their name and address in the first instance. Address first correspondence to Canadian Railway Builders, P. O. Box 601, Winnipeg, Man., Canada.

ELECTRIC RAILWAYS

Limestone, Maine—George Cook, Caribou, is interested in the construction of an electric railway from Limestone to Caribou, about nine miles.

Buffalo, N. Y.—The International Traction Co. contemplates the extension of its lines into the Reusens Park section. J. A. McKenna, Buffalo, is Secy.

Cortland, N. Y. — The Cortland Traction Co. has been granted permission to double-track its line in Cortland. Edwin Duffey, Cortland, is Treas. and Mgr.

Gleasonton, Penn.—The Gleasonton & Paddy Run Ry. Co. has been incorporated to construct an electric railway from Gleasonton to a point near Renovo, about 10 miles. I. W. Gleason is Pres.

Lititz, Penn.—The Berks & Lancaster Ry. Co. has been incorporated to construct an electric railway from Lititz to Womelsdork. The incorporators are Frank J. Duckett, T. Holland Paist, William Grimshaw, Oscar R. Dare, Joseph J. Dimond, and H. B. Longbottom, Philadelphia, and V. J. McGlesney, Phœnixville.

Augusta, Ga.—The Augusta-Aiken Ry. & Electric Co. has been granted a franchise to extend its line on Walton Way to the city limits. E. C. Deal, Augusta, is Gen. Mgr.

+**San Francisco, Calif.**—The Turkish Government has awarded a contract for the construction of a pavilion on the Exposition grounds to the NORTHWEST CONSTRUCTION CO., Merchants Exchange Bldg., at $40,000.

Edward T. Foulkes, Arch., Crocker Bldg., is preparing plans for the erection of a three-story hotel to be erected at Baker and Lombard Sts., at an estimated cost of $350,000.

+The Ohio State Commission to the Panama-Pacific International Exposition has awarded a contract to LANGE & BERGSTROM, of San Francisco, at $43,980 for the construction of the Ohio State pavilion on the Exposition grounds.

+The Board of Panama-Pacific Managers for Massachusetts has awarded a contract for the erection of a pavilion on the exposition grounds to W. D. HENDERSON at $52,978.

+**Fort William, Ont.**—The contract for the erection of the Drew school building, has been awarded to SEAMAN & PENNIMAN, at $76,684.

Winnipeg, Man.—The Ancient Order of Foresters will erect a lodge building at Winnipeg. The estimated cost is $100,000.

Edmonton, Alta.—Bids are being received by Magoon & McDonald, Archs., Tegler Block, for the erection of a club and apartment block on Second and Victoria Ave. The estimated cost is $250,000.

Medicine Hat, Alta.—Bids will be received until 4 p.m., July 6, by R. C. Desrochers, Secy., Dept. of Public Works, Ottawa, Ont., for the erection of additions and alterations to public building.

Prince Rupert, B. C.—Bids will be received until 4 p.m., July 6, by R. C. Desrochers, Secy., Dept. of Public Works, Ottawa, Ont., for the erection of a public building.

The Sullivan Machinery Co., of Chicago, announces that J. C. West has been transferred from the San Francisco office to the general office at Chicago, and that R. P. McGrath, of the Boston office, has been appointed district manager at San Francisco.

The Chicago Steel Tape Co., 6229 College Ave., Chicago, announces that it has opened a downtown office at 900 Lytton Bldg., Jackson Road and State Sts., which is in charge of H. D. Nelson.

Mr. George C. Isbester, for the past three years attached to the New York office of the Rail Joint Co., has been placed in charge of the Chicago office, 215 Railway Exchange.

CONTRACT PRICE

Intercepting Sewer—Newark, N. J.—Bids were received June 16, by the Passaic Valley Sewerage Commissioners for constructing Section No. 17, southerly portion, from (A) The Whiting-Turner Construction Co., Baltimore, Md.; (B) Beaver Engineering & Contracting Co., New York, N. Y.; (C) Merrill-Ruckgaber Co., New York, N. Y.; (D) Bruno & Petitti, Belleville, N. J.; (E) New York & New Jersey Construction Co., New York, N. Y.; (F) Harrison & Craig Co., Newark. The item bids were as follows:

Jos. H. Wallace & Co., Industrial Engineers, Temple Court Bldg., New York, announce that they have found it necessary to open an office at Montreal, Que., to take care of Canadian business. This office will be in charge of two members of the firm, Jos. Perry and P. R. H. Murphy.

The Industrial Works, Bay City, Mich., will handle business of the Chicago territory from the main office in Bay City. In the near future a sales office will be opened in Chicago under the name of the Industrial Works.

The Terry Steam Turbine Co., Hartford, Conn., informs us that business has been more satisfactory than in several months, and in order to take care of the increase, additional tools have been installed increasing the capacity of the shop approximately 25%.

The Trussed Concrete Steel Co. has moved its general offices to Youngstown, Ohio. This step was taken to bring the selling and manufacturing organizations in closer communication. At the same time, an office will be maintained in Detroit to take care of the sales inquiries originating in that territory. The Publicity Department of the company will remain in Detroit.

Contracts to Be Let

Bids received until July 8, 1914.

Sewage Screen

WEST [illegible] ST SEWAGE TREATMENT WORKS
CONTRACT NO. 2

Cleveland, Ohio

[illegible] proposals will be received at the office of the Commissioner of [illegible] and Supplies, No. 113 City Hall, until [illegible] July 8, 1914 for furnishing and installing a [illegible] self-[illegible] screen.

[illegible] of plans and specifications and blank proposals can be [illegible] at the office of the Commissioner of Engineering [illegible] No. [illegible] and No. 417 City Hall, after June 27.

The time [illegible] to complete the work is an essential part of this [illegible].

[illegible] must contain the full name of the party or parties [illegible] the same and all persons interested therein, and [illegible] accompanied by a certified check for Five Hundred [illegible] Dollars, payable to the City of Cleveland on a [illegible] that if the bid be accepted a contract will be entered into and the performance of it properly secured.

No proposal will be entertained unless made on the blanks [illegible] by the Commissioner of Engineering and delivered at the office of the Commissioner of Purchases and Supplies, No. [illegible] City Hall, previous to 12 o'clock M. on the day [illegible].

The City reserves the right to reject any or all bids.

A. R. CALLOW,
Commissioner of Purchases and Supplies.

Bids received until July 20, 1914.

Steel and Concrete Bridge

Perth Amboy, N. J.

Sealed proposals will be received by the Board of Chosen Freeholders at their room in the County Record Building at New Brunswick, N. J., on MONDAY, JULY 2[illegible], 1914, at 2:30 o'clock for the construction of a Steel and Concrete bridge across the [illegible] or crossing of the Lehigh Valley Railroad at Convery Place in the City of Perth Amboy, according to plans and specifications on file at the office of Thomas H. Hagerty, County Collector, New Brunswick, N. J., and at the office of Alvin R. Fox, Perth Amboy, N. J.

A deposit of Ten Dollars ($10.00) will be required for copies of plans which will be refunded upon the return of same in good condition.

Each bid must be accompanied by a certified check in the amount of $500.00 payable to the order of Thomas H. Hagerty, County Collector, without any conditional endorsements, which check shall be forfeited should the successful bidder fail to enter into contract and bond within ten days from the award of the bid.

The Board reserves the right to reject any or all bids if in their opinion it is to the best interest of the County so to do.

A. J. GERHARDT, Director.
Attest: ASHER W. BISSETT, Clerk.

Bids received until July 22, 1914.

Water Improvements and Repairs

Hudson, N. Y.

[illegible] will be received until 7:30 P. M., July 22, 1914, by the [illegible] of the Commissioners of Public Works, of the City of Hudson, N. Y., for furnishing material and labor [illegible]

[illegible]

M. [illegible]

[illegible]

Bids received until July 23, 1914.

Equipment for Sale

ENCOURAGEMENT IN THE BUILDING OUTLOOK

Figures have just been completed showing that in 22 cities of the country the plans filed in June this year called for an expenditure of $64,800,000, compared with $62,200,000 in the same month last year. A gain of nearly $3,000,000 was recorded in Eastern cities in June. This is by far the most favorable showing of the year, for it is a gain of 12%. For the first six months there was a falling off of 3.5%, showing a complete reversal of the trend.

In the West the outlook was good, but not as favorable as in the East. In 21 cities in the Middle West there was a gain in June of this year compared with last year of $800,000, or 2.5%. For the first six months of the year there was a decrease of 0.5%.

In eight cities in the Southern states there was a falling off of $1,166,000 in June, or 23%. For the half-year the decrease was less in proportion, amounting to $3,628,000, or 15.7%

For the entire country from which figures are available at this writing, including 51 cities, the building operations for the half year from plans filed with building inspectors amounted to $322,000,000, compared with $332,000,000 in the corresponding six months last year. The falling off of $10,000,000 is rather small, amounting to only 3%.

In the accompanying table is given the official figures representing the estimated cost of new buildings from plans filed with the building inspectors for June, 1914, and June, 1913. The table also includes the figures covering the first six months of this year and a similar period of last year.

A., for furnishing and delivering poiree trestles and recess engine pit covers for Dams Nos. 19 and 28, Ohio River, as follows: (a) 129,200 lb. metal work for Dam No. 19, (b) 223,800 lb. metal work for Dam No. 28; American Bridge Co. of New York, Pittsburgh, Penn., (a) $3010, (b) $6445, (c) total, $9456; King Bridge Co., Cleveland, Ohio, (a) $3036, (b) $7050, (c) $10,086; W. N. Kratzer & Co., Pittsburgh, Penn., (a) $3385, (b) $6177, (c) $9562; Union Foundry & Machine Co., Pittsburgh, Penn., (a) $3552, (b) $6638, (c) $10,190; Penn Bridge Co., Beaver Falls, Penn., (a) $2842, (b) $5931, (c) $8773 (recommended for acceptance); Henry Vogt Machine Co., Inc., Louisville, Ky., (a) $3715, (b) $8952, (c) $12,667; J. E. Moss Iron Works, Wheeling, W. Va., (a) $5491, (b) $9512, (c) $15,003. Noted May 28.

Levee—Vicksburg, Miss.—Bids will be received until 11 a.m., July 13, by Maj. J. R. Slattery, Corps Engrs., U. S. A., for about 7500 cu.yd. of levee work.

+Building—New Orleans, La.—The contract for the erection of the radio building at the naval station, has been awarded to HENRY MONK, Pensacola, Fla. at $5780. Noted June 25.

Repairs to Buildings—New Orleans, La.—The date of receiving bids for repairs to buildings, Naval Station, New Orleans, has been extended from 11 a.m., July 6 to 11 a.m., July 18, by H. R. Stanford, Chief Bureau of Yards and Docks, Navy Dept., Washington, D. C. Noted June 11.

Repairs to Wharf—New Orleans, La.—The date of receiving bids for repairs to wharf at New Orleans, has been extended from 11 a.m., July 6, to 11 a.m., July 18, by H. R. Stanford, Chief, Bureau of Yards & Docks, Navy Dept., Washington, D. C. Noted June 11.

Riprap Stone—Memphis, Tenn.—Bids will be received until 11 a.m., July 27, by Maj. E. M. Markham, Corps Engrs., U. S. A. for furnishing about 40,000 tons of riprap stone, rail delivery.

+Post Office—Winchester, Tenn.—Oscar Wenderoth, Superv. Arch., Treasury Dept., Washington, D. C., has awarded contract for the construction of a post office at Winchester to ALGERNON BLAIR, Montgomery, Ala., at $45,219.

★Buildings—West Point, Ky.—Bids will be received until 11 a.m., July 31, by Maj. J. C. Oakes, Corps Engrs., U. S. A., for constructing four brick dwellings at Dam No. 43, Ohio River, four miles below West Point, Key.

Building—Cincinnati, Ohio—Bids were received by the Secretary, Dept. of the Interior, for the erection of a two-story and cellar brick cement building for the weather bureau at Cincinnati, Ohio as follows: De Riso Co., Union, N. J., $18,228; McLennen Bros., Cincinnati, Ohio, $16,261; Charles Griffith & Sons Co., Cincinnati, Ohio, $17,750; Samuel Hurr, Cincinnati, Ohio, $16,000; Ohio Building & Construction Co., Cincinnati, Ohio, $15,900; William Miller & Son, Cincinnati, $16,927. Noted June 18.

Elevators—Dayton, Ohio—Bids were received by Oscar Wenderoth, Superv. Arch., Treasury Dept., Washington, D. C., for the installation of two electric passenger elevators, three hydraulic lifts, and a pumping plant in the U. S. post office and courthouse at Dayton as follows: The Ohio Elevator & Machine Co., Columbus, Ohio, $14,000, Faunt Le Roy Elevator Co., Baltimore, Md., $12,432; Kaestner & Hecht Co., Chicago, Ill., $13,794; Otis Elevator Co., Washington, D. C., $13,763. Noted June 11.

River Bulkhead—Alpena, Mich.—Bids were received for Alpena, follows: Jenkins & Davison, Alpena, Mich., at $6350; John Monaghan, Alpena, Mich., $4925; Riley & Monkman, Alpena, $12,930. Noted June 11.

★Breakwater—Chicago, Ill.—Bids will be received until 10 a.m., July 23, by Lieut.-Col. W. V. Judson, Corps Engrs., U. S. A., for constructing timber breakwater at Chicago Harbor, Ill.

+Building—Great Lakes, Ill.—The contract for constructing a two-story brick building at the naval station, Great Lakes has been awarded to C. W. PENCE, Waukegan, Ill., at $14,515. Noted June 4.

+Towers—Great Lakes, Ill.—The following bids were received by the Chief, Bureau of Yards & Docks, Navy Dept. Washington, D. C., for constructing foundations for two 100 ft. steel towers at the Naval Training station: C. W. PENCE, 231 North St. James St., Waukegan, Ill., $2480; (a) excavation $1 per cu.yd., (b) concrete $10 cu.yd. (awarded contract) M. E. Baldwin Construction Co., 140 South Dearborn St., Chicago, Ill., $4195; M. McCugo, Waukegan, Ill., (a) $1.50, (b) $14; R. F. Wilson & Co., 154 West Randolph St., Chicago, Ill., $4020, Pittsburgh Des Moines Steel Co., 886 Curry Bldg., Pittsburgh, Penn., $3500; John Jeffrey, 127 North Dearborn St., Chicago, Ill., $2975. Noted July 2.

★+Steel Work and Cable—Ashland, Wis.—The contract for furnishing 11,000 ft. of submarine armored cable for the Ashland light station, has been awarded to the STANDARD UNDERGROUND CABLE CO., at $2739. Noted May 28.

★Gates, Etc.—Great Falls, Mont.—Bids will be received until 2 p.m., Aug. 4, by F. H. Newell, Dir. U. S. Reclamation Service, Great Falls, for furnishing structural steel and stands and accessories, for projects in the northern division.

★Metal Flumes—Great Falls, Mont.—Bids were received for furnishing and delivering f. o. b. manufacturer's plant, metal flumes as follows: (a) 97 lin. ft. of 5 ft. 9 in. flumes, (b) 32 lin. ft. 5 ft. 9 in flumes, (c) 6 ft. 4¼ in. (d) 7 ft., (e) 10 ft. 10 in., (f) 10 ft. 10 in. (curved), (g), 11 ft. 5½ in.

[illegible] West Colfax Ave., Denver, Colo. [illegible] Calvert & F[illegible] [illegible] Kramer Mfg. Co. [illegible] Noted [illegible]

Levee Work—[illegible] All bids received June 4 by [illegible], U. S. A., Vicksburg, Miss., for [illegible] levee on [illegible] River have been rejected. Noted [illegible]

✦Electric Lighting System—Fort [illegible], Tex.—The [illegible] electric lighting system at Fort [illegible] has been awarded to the NATIONAL TELEGRAPHONE [illegible] Co., [illegible], Tex. Noted May 28.

●Pipe—[illegible], Colo.—Bids will be received until 2 p.m., [illegible] by F. H. Newell, Dir., U. S. Reclamation Service, [illegible] for constructing approx. [illegible] ft. of [illegible] wood stave pipe for the [illegible] South Dakota, the Uncompahgre Valley Project, Colo., and the North Platte Project, Nebraska.

Post Office—[illegible], Colo.—Bids were received as follows, June [illegible] by Oscar Wenderoth, Supervising Archt., Treasury Dept., Washington, D. C., for the construction of a post office [illegible] (a) limestone, (c) sandstone, (e) white Colorado marble, (f) white marble other than Colorado. J. H. Wiese, [illegible], Neb., (a) $[illegible], (c) $127,[illegible], (d) $117,[illegible]. R. J. [illegible], Colo., (a) $[illegible], (f) $146,[illegible], (e) $166,[illegible]. [illegible], Pasadena, Calif., (a) $[illegible], (h) $[illegible]. [illegible] & Wenzel Construction Co., Wichita, Kan., (a) $[illegible], (f) $[illegible], (c) $[illegible], (d) $118,[illegible]. George [illegible] Co., Chicago, Ill., (a) $[illegible], (c) $127,20[illegible], (d) $[illegible]. F. H. [illegible], Denver, Colo., (e) $165,[illegible], (h) $[illegible], (c) $[illegible]. One-story and basement building with [illegible] stone [illegible] ft. ground area, fireproof construction. Noted May 28.

●Bridge—Boise, Idaho—Bids will be received until 2 p.m., [illegible] by F. H. Newell, Dir., U. S. Reclamation Service, Boise, for erecting one [illegible]-ft. span steel highway bridge over the spillway channel, Arrowrock Dam, Boise project, Idaho.

Turbine Exciter—Puget Sound, Wash.—Bids will be received until [illegible] July [illegible] by H. R. Stanford, Chief Bureau of Yards & Docks, Navy Dept., Washington, D. C., for furnishing and installing one [illegible]-kw. turbine-driven exciter in the central power plant at the Navy Yard, Puget Sound, Wash. Noted [illegible] July [illegible].

Post Office—Medford, Ore.—Bids will be received until 3 p.m. Aug. [illegible] by Oscar Wenderoth, Supervg. Archt., Treasury Dept., Washington, D. C., for the construction complete (including mechanical equipment except elevators) of the U. S. post office at Medford, Ore.

Boilers and Accessories—[illegible]—Bids will be received until 11 a.m. July [illegible] by H. R. Stanford, Chief Bureau of Yards and Docks, Navy Dept., Washington, D. C., for furnishing and installing four [illegible]-hp. water tube boilers, with accessories, in the central power plant, naval station, [illegible].

MISCELLANEOUS

Dredging—Boston, Mass.—[illegible] Bids will be received [illegible] July [illegible] by the State Board of Harbor and Land Commissioners [illegible] for dredging in [illegible] Harbor. The work calls for [illegible]. [illegible] F. Williams is Ch. Engr.

Breakwater—[illegible]

●Museum Cases—Albany, N. Y.—[illegible]

Dredging, Etc.—[illegible]

Dock, Coal Pockets, Etc.—[illegible]

●Subway—[illegible]

●Borings—New York, N. Y.—[illegible]

●Subway—New York, N. Y.—[illegible] two-track railroad in the Borough of Manhattan, connecting the Broadway Subway with the Queensboro Bridge and extending from Seventh Ave. to Fifth Ave., where the two tracks diverge, one continuing through [illegible]th and the other through [illegible]th St. to Second Ave.

Dikes—Redfield, N. Y.—The State Conservation Commission, Albany, has granted permission to the Salmon River Power Development Co. to construct dikes along the east side of Stillwater Reservoir at Redfield.

Channel Work—Rochester, N. Y.—The city plans to deepen the Genesee River at a cost of $[illegible]. F. T. [illegible] is City Engr.

Dock Work—Keansburg, N. J.—The Keansburg Steamboat Co. will enlarge its dock, now about one-half mile long, to accommodate new trucks of the Jersey Central Traction Co.

Fire Apparatus—Orange, N. J.—The City Commission plans to purchase two motor trucks and two motor hose wagons. D. F. Minahan is City Clk.

Harbor Work—Trenton, N. J.—J. R. Fell, Jr., City Engr., has completed plans for the proposed basin to be constructed in connection with the channel now being dredged. It will be [illegible] ft. Plans for the municipal harbor terminus at Fair and Federal Sts. have also been completed.

Stable—Pittsburgh, Penn.—B[illegible] Bros., [illegible] Ave., Pittsburgh, have submitted the lowest bid to the Department of Charities for constructing a new stable at about $[illegible]. The building will be two stories high.

✦Barns—State College, Penn.—Pennsylvania State College will construct three dairy barns to cost $[illegible].

Fire Station—Wilkes-Barre, Penn.—Bids will be received until noon, July 14, by F. H. Gates, City Clk., for constructing a fire station.

Wharves—Augusta, Ga.—Bids are being asked by the Augusta Barge Line Co., Augusta, for constructing wharves at the foot of Fifth St. The structures will be of steel.

✦Levee—Augusta, Ga.—The city has awarded the contract to A. J. TWIGGS & SONS, Augusta, for constructing levee between Sixth St. and East Boundary, at about $[illegible].

✦Ditches—Senatobia, Miss.—The Senatobia Creek Drainage Commission has awarded the contract to A. C. MILLER, Walnut Ridge, Ark., for constructing two main ditches.

✦Levee Work—New Orleans, La.—The State Board of Engineers, New Orleans, has awarded the contract to HELGASON BROS., Vicksburg, Miss., for levee work, at [illegible] per cu. yd. The work calls for [illegible] cu. yds.

Drainage—Jackson, Tenn.—Madison County has sold $[illegible],000 of drainage bonds, and will soon award a contract for the construction of a drainage canal 11 miles long, [illegible] ft. wide and 11 ft. deep.

Subway—Cincinnati, Ohio—At the election in November the citizens will vote on the proposition to issue $[illegible] in bonds for the construction of the proposed [illegible] subway. Frank Krug is Ch. Engr.

Elimination of Grade Crossings—[illegible]—The city is arranging to spend $[illegible] for the elimination of the grade crossings of the New York, Chicago & St. Louis Ry. from Fulton Road S. W. to West [illegible] St. Robert Hoffman is City Engineer.

✦Pier Work—Chicago, Ill.—The contract has been awarded by the city, it is reported, to E. L. SCHEIDENHELM, for constructing the superstructure of the proposed municipal pier, at $[illegible].

Grandstand—Ames, Iowa—The Iowa State University, Ames, plans to construct a concrete grandstand and fence. Estimated cost, $[illegible].

Drain—[illegible], Iowa—Bids will be received until 1 p.m. July 11 by C. E. R[illegible] at the [illegible] State Bank, for constructing [illegible] Drain in Harrison Township. Estimated cost, $[illegible].

✦Ditch—[illegible], Minn.—The county has awarded the contract to the NORTHWESTERN DRAINAGE CO., Thief River Falls, Minn., for constructing Ditch [illegible] at [illegible] per cu. yd.

✦Ditch—[illegible], Minn.—The contract has been awarded by the county to WILSON BROS., Cromwell, Minn., for Ditch [illegible] at [illegible] per cu. yd., or $[illegible].

Ditch—Marshall, Minn.—Bids will be received until July [illegible] by [illegible], County Audr., Marshall, for constructing Ditch No. [illegible]. Estimated cost, $[illegible].

Lake Protection—St. Joseph, Mo.—Residents of St. Joseph are considering spending $[illegible] to protect Lake Contrary from the encroachments of the Missouri River. Charles [illegible] is City Engr.

✦Metal Cases—Little Rock, Ark.—The State Capitol Commission has awarded the contract to the [illegible] & LITHOGRAPHING Co., Little Rock, for metal vault cases and shop cases for the state capitol at $[illegible].

✦Terminal—Dallas, Tex.—The contract for constructing the union station and terminals has been awarded to JOHN W. [illegible], of [illegible], Mo., at about $[illegible]. In addition to the new station building, the contract includes [illegible] of terminal tracks and a [illegible] across the Trinity River. All the railroads entering Dallas [illegible] the new station and terminals, and the work is being paid for by those roads. The lines interested are the Texas & Pacific, the Missouri, Kansas & Texas Ry., St. Louis Southwestern Ry., [illegible], Chicago, Rock Island & Pacific Ry., Atchison, Topeka & Santa Fe Ry., Southern Pacific Co. and the Trinity & Brazos Valley Ry.

Wharves—Houston, Tex.—The citizens of Harris County will soon vote on the proposition to issue $[illegible] in bonds for wharves along the Houston Ship Channel.

Drydock—Port Arthur, Tex.—A drydock [illegible] ft. long and [illegible] ft. wide will be built at Port Arthur. Estimated cost, $[illegible]. [illegible], Port Arthur, is interested.

+Harbor Work—Seattle, Wash.—The W. T. BUTLER CONSTRUCTION CO., Central Bldg., Seattle, has been awarded the contract by the Seattle Port Commission for main elevator foundations, East Waterway terminals, at $25,180. The contract includes 62,000 lin.ft. of piling, as well as foundations. Other bids were: Weymouth Construction Co., $26,272; Franklin Engineering Co., $26,696; alternate bid $25,322; H. Brandt Construction Co., $26,910; Graff Construction Co., $27,243; Washington Construction Co., $28,308; M. J. Hursen Co., $28,600; Puget Sound Bridge & Dredging Co., $28,835; Harrington-Peters Co., $28,940; alternate bid, $27,700; Nettleton-Bruce-Eachbach Co., $30,605; Jahn Constructing Co., $31,540; McRae Bros., $31,697; Sound Construction & Engineering Co., $21,718; C. F. Martin, $32,492.

Comfort Stations—Seattle, Wash.—The city is considering the construction of public comfort stations and rest platforms. Estimated cost, $25,000.

+Dock Superstructure—Seattle, Wash.—The Port of Seattle Commission has awarded the contract to HARRINGTON-PETERS CO., Seattle, for constructing the superstructure of the Hanford St. Dock, at $87,000. Noted July 2.

Dikes—Tacoma, Wash.—The County Commissioners of Pierce County, Tacoma, will establish a diking district outside the city limits of Tacoma, to reclaim between 1500 and 1900 acres of land.

+Lumber—Los Angeles, Calif. — The Harbor Commission has awarded the contract to the SAN PEDRO LUMBER CO., for 1,500,000 ft. of lumber to be used in connection with the improvement of the inner harbor.

CONTRACT PRICE

+Bridge Construction—Tiffin, Ohio—Bids were received by the Board of County Commissioners, May 23, for the construction of three concrete bridges across the Sandusky River at Market, Huss and Ella Sts., Tiffin, from (A) VANG CONSTRUCTION CO., Cumberland, Md. (awarded contract for Market St. bridge); (B) J. H. & LEWIS JONES, Fostoria, Ohio and Kansas, Ohio (awarded contract for Huss St. bridge); (C) Wynkoop, McGormley Co., Toledo, Ohio; (D) N. R. Porterfield, 17 Battery place, New York, N. Y.; (E) A. SCHECKELHOFF & SON, Fremont, Ohio (awarded contract for Ella St. bridge); (F) Walter S. Newhall Co., Citizens' Bldg., Cleveland, Ohio; (G) Fritz-Rumer-Cook-Grant Co., Eberly Bldg., Cleveland, Ohio; (H) I. D. Tuttle Co., Bushnell Bldg., Springfield, Ohio; (I) Morse-McGorriam & Bassett, Cleveland, Ohio. The item bids were as follows:

+Ferry Boat—Oakland, Calif.—The San Francisco-Oakland Terminal Rys. Co. has awarded the contract for the construction of a 230-ft. ferry-boat to the MOORE & SCOTT IRON WORKS, Oakland, at $305,000.

+Granite Work—Oakland, Calif.—The City Council has awarded the contract for granite work on the municipal auditorium to the CALIFORNIA GRANITE CO., San Francisco, Calif., at $71,857.

Dry Dock—San Francisco, Calif.—The Union Iron Works will ask for bids soon for the construction of a dry-dock to cost about $2,500,000. John A. McGregor, 2567 Green St., San Francisco, is Pres.

★Tunnel—San Francisco, Calif.—Bids will be received by the Board of Public Works until Aug. 19 for the construction of the Twin Peaks Tunnel. It will be 12,000 ft. long, 30 ft. wide, 28 ft. high and will be lined with concrete. Estimated cost, $3,300,000. Frederick J. Churchill is Secy. Bd. Noted May 21.

Plans and specifications are on file at the office of Engineering News, 505 Pearl St., New York.

Dams and Canals—San Francisco, Calif.—The Department of the Interior has given Leland & Myers, San Francisco, Calif., authority to proceed with reclamation work in Modoc County. About $80,000 will be expended in constructing dams and canals.

Pavilion—San Francisco, Calif.—A National Committee has been formed for the purpose of building a British-American pavilion at the Panama-Pacific International Exposition, San Francisco. This body will work in coöperation with the British Committee formed for the same purpose in London, whose members, it is expected, will contribute funds for the purpose and send an exhibit. This plan has no bearing on the arrangements already made for the British competitive exhibitions in the various industrial sections. Estimated cost, $300,000. The British California Association, San Francisco, is interested.

Foundations for Dam — Santa Barbara, Calif. — S. M. Kerns, 625 West Ocean Ave., Long Beach, Calif., was the lowest bidder at $39,360 for the construction of the foundation for the Gibraltar Dam at Santa Barbara. The work will require approximately 980 cu.yd. of excavating rock on abutments, 6540 cu.yd. of material from the river bed, and placing 5635 cu.yd. of concrete. Noted May 28.

Contracts to Be Let

Bids received until July 28, 1914.

Barge Canal Improvements

STATE OF NEW YORK
OFFICE OF SUPERINTENDENT OF PUBLIC WORKS
Albany, July 29th, 1914

NOTICE TO CONTRACTORS—

Sealed proposals will be received by the undersigned at his office in the Capitol at Albany, N. Y., until twelve o'clock noon of Tuesday, July 28th, 1914, at which place and hour they will be publicly opened and read, for improving the New York State canals pursuant to the provisions of Chapter 147 of the Laws of [illegible] and of the amendments thereto, as follows:

—1—

CONTRACT NO. 119
[illegible] Canal—Section 2

For furnishing and driving a quantity of steel sheet piling, extending the concrete apron and performing all incidental work connected therewith at Movable Dam Five at Rotterdam, N. Y.

Sheets 1 and 2.

—2—

CONTRACT NO. 120
Erie Canal—Sections 2 and 3

[illegible] of the superstructures of the following [illegible] dams over the Mohawk River:

Dam [illegible] at Rotterdam, Station 1662 + 45, Erie canal
Dam 6 at Cranesville, Station 1987 + 79, Erie canal
Dam [illegible] at Amsterdam, Station 2281 + 16, Erie canal
Dam [illegible] at Tribes Hill, Station 2413 + 17, Erie canal
Dam [illegible] at Yosts, Station 2[illegible] + 64, Erie canal
Dam 10 at Canajoharie, Station [illegible], Erie canal
Dam 11 at Fort Plain, Station 3[illegible]53 + 85, Erie canal

[illegible]

Plans [illegible] and detailed specifications, engineer's estimate of quantities, proposal blanks, form of contract and [illegible] required and other information for proposers may be [illegible] at the office of the Superintendent of Public Works at Albany, N. Y., at the office of the Assistant Superintendent of Public Works for the Middle Division at Syracuse, N. Y., at the office of the Assistant Superintendent of Public Works for the Western Division at Rochester, N. Y., and at the canal office, [illegible] Exchange, Buffalo, N. Y.

Copies of detailed plans or drawings may be obtained from the [illegible] at Albany, N. Y., upon payment [illegible]

[illegible]

Each proposal must be addressed to the Superintendent of Public Works, Albany, N. Y., and must be endorsed on the envelope with the name of the construction for which the proposal is made.

Award, if made, will be made to the person or persons whose proposal shall be lowest in cost to the State for doing the work, and which shall comply with all provisions required to render it formal. Before any award shall be made the lowest bidder will be required to satisfy the Superintendent of Public Works of his ability to provide suitable equipment and materials for the proper performance of the work.

The right is reserved to reject all proposals and readvertise and award the contract in the regular manner if, in the judgment of the undersigned, the interests of the State will be enhanced thereby.

DUNCAN W. PECK
Superintendent of Public Works

Bids received until July 20, 1914.

Sanitary Sewer, Special Manholes, Combined Sterilizing and Pumping Plant

Tarentum, Pa., June 27, 1914.

The Tarentum Borough Council will receive bids for the construction of approximately [illegible] ft of 12 inch sanitary sewer ranging in depth from 3 ft to 26 ft. Also 17 special manholes and a combined sterilizing and pumping plant, as per the plans drawn by [illegible], Consulting Engineer, 1210 House Bldg., Pittsburgh, Pa., up until July 20, 1914, at [illegible] o'clock P.M. The bids will be received on one or all of the three parts of the contracts, viz.: Part I. Sewer and manholes. Part II. Structural work and [illegible] with necessary piping, valves and mechanical equipment exclusive of the pumps and motors with their regulating devices. Part III. Motor driven centrifugal pumps. The motor driven centrifugal pumps may be bid separately, but completely installed by the firm furnishing [illegible] prepared by the Borough. Each proposal is to be presented sealed and addressed to Mr. W. A. [illegible], Borough Secretary, and plainly marked on the lower left hand corner "Proposal for sanitary sewer and manholes" or proposal for the part or parts bid upon. In the upper left-hand corner the name of the firm bidding is to be plainly written. Each proposal is to have [illegible] a certified check or bidders bond in amount equal to five (5) percent of the bid [illegible] the good faith of the bidder. The successful bidder will be required to give bond for one hundred (100) per cent of [illegible] for the faithful performance of the work. Plans and specifications may be obtained from the engineer.

Council reserves the right to reject any or all bids.

W. F. DENNY, President of Council.
W. A. [illegible], Borough Secretary.

[illegible], Consulting Engineer,
1210 House Bldg.,
Pittsburgh, Pa.

THE HALF YEAR'S BUILDING RECORD ..

Recent reports from eight cities on the Pacific Coast complete the figures for the first half year's building operations in 59 of the largest cities. In June plans filed in these 59 cities called for an expenditure of $71,546,000 compared with $69,725,000 in the corresponding month in 1913. This is a gain for June of 2.6%, and is the first gain of any importance recorded this year. For the first six months plans filed called for an expenditure of $367,171,000 compared with $385,958,000 in the corresponding six months of last year. This loss of $18,000,000 was scattered throughout the Eastern States in the first few months of the year and later in the Southern and Pacific Coast States. In the Middle West there has been almost a consistent gain throughout the six months. The decrease expressed in terms of percentage leaves 59 cities in the half year with 4.7%.

In eight cities on the Pacific Coast, the figures for which are given in the accompanying table, the contemplated building operations from plans filed in June aggregated $6,030,000 compared with $7,373,000 in June of 1913. This is a loss of 13.2%. In the first six months the loss was even greater in proportion, amounting to 17%. A large portion of this is due to the filing of building plans in Los Angeles in 1913 but for the first six months San Francisco shows an enormous gain.

PACIFIC COAST STATES

	June 1914	June 1913	First six months of year 1914	1913

RAILWAYS

West Virginia—Morgantown & Wheeling Ry.—This company plans to construct a line from Blacksville, W. Va., to Wheeling, W. Va., 55 miles. G. C. Sturgiss, Morgantown, W. Va., is interested.

Florida—See item under Alabama.

Florida—Bay, City, Lynn Haven & Northern R.R. See item under Alabama.

Alabama—Alabama Great Southern R.R.—This company is asking for bids for second-track work from Birmingham, Ala., to Grasselli, Ala., 6.4 miles; York, Ala., to Cuba, Ala., 5.45 miles; Meridian, Miss., to Russell, Miss., 6.63 miles. C. Dougherty, Cincinnati, Ohio, is Ch. Engr.

Louisville & Nashville R.R.—This company, it is reported, plans to construct an extension from Lax, Ala., to Decatur, Ala., 14 miles. H. C. Williams, Louisville, Ky., is Engr. Const.

Alabama—The construction of a railroad from the coal fields of Alabama to the Atlantic Coast at Jacksonville, Fla., is under consideration. H. P. Reed, Birmingham, Ala., is interested.

Alabama—Bay City, Lynn Haven & Northern R.R.—This company is being organized by New York and Philadelphia capitalists for the purpose of constructing a railroad to connect Montgomery, Ala., and St. Andrews Bay, Fla. It is proposed to make the Birmingham, Columbus & St. Andrews Bay R.R. part of the route. This road is 38 miles long from Chipley, Fla., to St. Andrews Bay, and is now in the hands of a receiver. Construction immediately in prospect is from Chipley northward to Hartford, Ala., about 28 miles. From Hartford to Montgomery the projected route is via Enterprise and Troy, Ala. It is planned to build terminals at Southport, Fla., the southern end of the existing road, which will include docks, wharves and warehouses. A. D. Campbell, Chipley, Fla., is receiver of the B. C. & St. Andrews Bay R.R. Noted July 9.

Alabama Great Southern R.R.—This company plans improvements at Tuscaloosa to include track extension and depression. C. Dougherty, Cincinnati, Ohio, is Ch. Engr.

Mississippi—Nashville, Shiloh & Corinth R.R.—See item under Tennessee.

Mississippi—Alabama Great Southern R.R. — See item under Alabama.

Mississippi—Columbus Lumber Co.—This company plans to construct a railroad from Columbus, Miss., to Winfield, La. The line will pass through timber lands in Western Alabama recently purchased by the company. The offices of the company are located at Columbus, Miss.

Louisiana—Columbus Lumber Co.—See item under Mississippi.

Tennessee—Nashville, Shiloh & Corinth, R.R.—The citizens of Centreville, Tenn., have voted in favor of issuing bonds for $150,000 to aid this company to construct its proposed line from Nashville, Tenn., to Corinth, Miss. C. C. Thoms, Corinth, Miss., is interested.

Tennessee—Southern Ry.—This company, it is reported, is having surveys made for its proposed cut-off from Bulls Gap, Tenn., to either Newport or Leadvale, Tenn., 20 miles. W. H. Wells, Washington, D. C., is Ch. Engr. Const.

Kentucky—Paducah & Illinois R.R. — This company is making surveys for its proposed railroad from Paducah, Ky., to the site of the proposed bridge over the Ohio River at Metropolis, Ill. Charles Broadbeck, Paducah, is Ch. Engr.

Michigan—Lansing Connecting R. R.—This company has been incorporated to construct a railroad. G. E. Hutchinson, Lansing, is Secy.

Illinois—Paducah & Illinois R.R.—See item under Kentucky.

Wisconsin—Balsam Lake & Eastern R.R.—This company has been incorporated for the purpose of constructing a railroad from Balsam Lake, Wis., to Centuria, Wis., eight miles. Capital, $100,000. Among the incorporators are W. R. Taylor, J. W. Park and H. W. Radcliffe.

Kansas—Missouri Pacific R.R.—See item under Oklahoma.

✚**Nebraska**—Chicago, Burlington & Quincy R.R.—This company has awarded the contract to PETERSEN & CO., Omaha, Neb., for the construction of its proposed cut-off from Yutan, Neb., southeast to Chalco, Neb. The work calls for a 300-ft. trestle over the Elkhorn River and a 1700-ft. trestle over the Platte River. Noted June 4.

✚**Missouri**—Rolla, Ozark & Southern R.R.—This company has awarded the contract to J. E. WALKER, Rolla, Mo., for constructing its proposed line from Rolla to Anutt, Mo., 18 miles. Noted July 2.

Missouri—Kansas City, Mexico & Orient Ry.—A committee representing the bondholders of this company purchased the line, July 6, for $6,000,000. The receivership will end Sept. 1 and the road will be completed. William T. Kemper, of Kansas City, Mo., is amon gthose interested.

Texas—Gulf, Colorado & Sante Fe Ry.—This company has taken over the Concho, San Saba & Llano Valley R.R., the Texas & Gulf R.R., the Gulf & Interstate R.R. and the division of the Pecos & Northern Texas Ry. south of Sweetwater, Tex. F. Merritt, Galveston, Tex., is Ch. Engr.

Oklahoma—Missouri Pacific R.R.—The city of Buffalo, Okla., has voted to issue $100,000 in bonds to secure the extension of this company's line from Hardtner, Kan., to Buffalo. J. R. Stephens, St. Louis, Mo., is Ch. Engr.

Oklahoma—Clinton, Oklahoma & Western Ry.—This company has been taken over, it is reported, by Frank Kell, Wichita Falls, Tex., who plans to construct extensions. The line is 52 miles long and runs from Clinton, Okla., to Strong City, Okla.

✚**Idaho**—Intermountain R.R.—This company has awarded a contract to the OREGON BRIDGE & CONSTRUCTION CO., for constructing a portion of its proposed line in the Boise Basin. The company is a subsidiary of the Boise-Payette Lumber Co. Noted Apr. 16.

Washington—Northern Pacific Ry.—This company plans to construct a freight yard to have 15 tracks, at the head of Commencement Bay, Tacoma, Wash. Estimated cost, $197,000. W. L. Darling, St. Paul, Minn., is Ch. Engr.

Washington—Northern Pacific Ry. — This company will spend $375,000 for track improvements in Tacoma, Wash.

British Columbia—Canadian Northern Ry.—This company will start work this month on its Kamloops-Okanogan branch, in British Columbia. Length, about 148 miles. W. H. McLeod, Winnipeg, Man., is Gen. Mgr. and Ch. Engr.

Canadian Pacific Ry.—The Provincial Department of Railways has approved the plans of this company, providing for a further extension of its line on Vancouver Island, to Duncan Bay. F. W. Peters, Vancouver, B. C., is Supt. British Columbia Division.

ELECTRIC RAILWAYS

Elizabeth, N. J.—The Board of Trade is considering the establishment of an electric railway to connect Elizabeth, Rahway and Linden.

Girardville, Penn.—The Schuylkill Ry. Co. contemplates the extension of its lines into Delano and Lakeside. William S. Leib, Girardville, is Gen. Mgr.

Kane, Penn.—Plans are being prepared for the construction of an electric railway from Kane to St. Mary's, Johnsonburg and Ridgway, about 33 miles.

Rock Hill, S. C.—The Carolina Traction Co. is preparing to extend its line on Elm, Park and Crawford Sts. in Rock Hill. James S. White, Rock Hill, is Secy. and Mgr.

Albany, Ga.—The Albany Transit Co. contemplates the construction of a one-mile extension to its line. J. C. Fulford, Albany, is Secy. and Pur. Agt.

Savannah, Ga.—The City Council has granted a franchise to the Savannah Electric Co. to extend its line on Habersham St. to connect with the line at Chatham Crescent. A. L. P. Smith, Savannah, is Pur. Agt. Noted July 2

Columbus, Miss.—The Mississippi Electric Ry. Co has been incorporated to build an electric line from Columbus, Miss., to Memphis, Tenn. C. F. Sherrod, Columbus, is interested.

Nashville, Tenn.—The [illegible] Cumberland Valley & Interurban Electric [illegible] Co. is making preliminary arrangements for the construction of an electric railway to connect Nashville and Sparta, via Smithville, about [illegible] miles. W G Baird, Lebanon, is Pres.

Middlesboro, Ky.—W Godfrey Hunter, Middlesboro, is interested in the construction of a five-mile electric railway in Middlesboro and vicinity.

Ironton, Ohio.—Preliminary arrangements are being made by the Ironton Electric Light & Ry Co. for the extension of its line from Sc[illegible]ville to Hanging Rock. W W Magoon, Huntington, W Va, is [illegible] Mgr.

♦Hillsdale, Mich.—The Tri-State Ry Co has awarded a contract for the construction of its line from Hillsdale to [illegible] to A C LINSBACH & CO, Chicago, Ill. Noted June 11.

Beardstown, Ill.—The Western Illinois Ry Co is making preliminary surveys for the construction of an electric railway from Beardstown, Ill., to Burlington, Iowa. G T Cappel, [illegible], Ill., is interested.

Pekin, Ill.—(Official)—See item under Miscellaneous Drainage District Work—Pekin, Ill.

Madison, Wis.—The Janesville & Madison Traction Co has completed arrangements and will soon start work on the construction of its proposed electric railway to connect Madison and Janesville. Frank H Weston, Madison, is interested. Noted May 14.

Baxter Springs, Kan.—The Oklahoma-Kansas Ry Co. is considering plans for the construction of an electric railway to connect Newkirk, Ponca City, Arkansas City, Blackwell, Enid, Perry, Guthrie, Guedo Springs and Tonkawa. C F Lambert, Kansas City, is Ch Engr.

Salina, Kan.—The Council has granted a franchise to the Salina Street & Interurban Ry Co to extend its lines in Salina. H C Smither is Pres.

Wichita, Kan.—The Arkansas Valley Interurban Ry Co. is considering plans for extending its line from Newton to Salina and from Halstead to Wichita. O A Boyle, Wichita, is Vice-Pres and Gen Mgr.

Columbia, Mo.—F S Mordant, Chicago, Ill., is making preliminary arrangements for the construction of an electric railway from Fulton to Montgomery City and Columbia, where a city street car system will be established. Noted June 2[illegible].

Mansfield, Mo.—R S Wickersham, North Yakima, Wash., is interested in the construction of an electric railway from Mansfield, Mo., to Cotter, Ark.

♦Dallas, Tex.—The Eastern Texas Traction Co has awarded the contract for completing its interurban electric railway between Dallas and Greenville to the STONE & WEBSTER ENGINEERING CORPORATION, Boston, Mass.

El Paso, Tex.—Plans are being prepared by the El Paso Electric Ry Co for the extension of its lines in El Paso. H S Potter, El Paso, is Gen Supt.

Texas City, Tex.—The County Commissioners have granted a franchise to the Texas City Street Ry Co to extend its lines in Texas City. Thomas J Davis, Texas City, is Pres.

Oklahoma City, Okla.—C H Hale and J W Tippon are interested in the construction of a system of interurban electric railway lines in Oklahoma. The proposed railway will connect Oklahoma City, Sapulpa, Bartlesville, Tulsa, Muskogee, McAlester and various other Oklahoma cities.

Los Angeles, Calif.—The City Council has granted a franchise to the Pacific Electric Ry Co. to construct an elevated railway from the rear of the Pacific Electric Bldg to [illegible] St. The structure will be of steel. The plans were prepared a year ago and the cost is estimated at $[illegible]00,-[illegible]. J McMillan, Los Angeles, is Gen Mgr.

The Pacific Electric Ry Co contemplates constructing a [illegible] across [illegible] Lake Park from Hill St. It will be a portion of the subway to Santa Monica. J McMillan is Gen Mgr.

San Francisco, Calif.—The Bay View Improvement Club has petitioned the Board of Supervisors to extend the municipal electric railway on Potrero Ave to Hunter's Point dry [illegible].

San Lorenzo, Calif.—The City Council has granted a franchise to the San Francisco-Oakland Terminal Ry. [illegible] Co. to double track its line on Telegraph Road [illegible] San Lorenzo. [illegible] R. [illegible], Oakland, is Vice-Pres and Gen. Mgr.

Bridgeburg, Ont.—Surveys are being made for the construction of the proposed electric railway to connect Bridgeburg and Fort [illegible].

Ottawa, Ont.—The [illegible] & Ottawa Electric Ry Co is [illegible] for the construction of an electric railway from Ottawa to [illegible], about [illegible] miles. [illegible]

LIGHT, HEAT AND POWER

Hartford, Conn.—The Connecticut Co is preparing plans for the [illegible] and extension of its power plant on [illegible].

♦Norwalk, Conn.—The contract for constructing a [illegible] [illegible]

♦New York, N. Y.—[illegible]

Butler, N. J.—At a recent election bonds for $[illegible] were voted, the proceeds of which will be used for the construction of a municipal electric-light plant. Noted June 11.

Birdsboro, Penn.—The construction of a municipal electric-light plant is under consideration.

Lansford, Penn.—Plans are being prepared by Jacoby & Weishampel, Commonwealth Bldg., Allentown, for a brick and concrete power station for the Panther Valley Electric Light Co, at Lansford.

♦Marion, Penn.—JOHN P McSHAIN, 631 North 17th St., Philadelphia, has been awarded the contract for the construction of an addition to the power house at Marion for the Sisters of Mercy. F. Durang & Co are the Archs.

Hertford, N. C.—See item under "Sewers."

Quitman, Ga.—The city is considering the proposition to issue bonds for $10,000, the proceeds of which will be used for the enlargement and improvement of the municipal electric-light plant. A W Knight is City Clk.

Gurley, Ala.—H A Smith, owner of the local electric-light plant, which was recently destroyed by fire, is considering plans for the reconstruction of the plant.

Winnsboro, La.—Carl Ship is interested in the construction of an electric-light plant at Winnsboro.

Hazard, Ky.—An electric power plant will be constructed by the Perry County Collieries Co, which will establish coal operations near Hazard. W J Von Borries, 110 South Seventh St., Louisville, Ky., is interested.

Hazel, Ky.—A committee has been appointed by the Commercial Club to investigate the feasibility of establishing an electric-light plant at Hazel.

♦Lexington, Ky.—The contract for the installation of an electric-light plant in the Transylvania University has been awarded to FRANK CORBIN, Lexington.

Archbold, Ohio—Plans are being prepared by the Archbold Electric Light & Power Co. for the construction of a 10-mile transmission line. R S Rodenhuis is Gen. Mgr.

Bluffton, Ohio—An expenditure of $20,000 is contemplated for the enlargement and improvement of the municipal electric-light plant and water system.

Cleveland, Ohio—Bids will be received by the Commissioner of Purchases and Supplies, City Hall, until noon, July 17, for erecting a power house for the Cleveland city hospital. W H Winans is Secy.

Fremont, Ohio—The Ohio Light & Power Co contemplates the enlargement and improvement of its plant at Fremont. Frank Espy, Tiffin, is Mgr.

Millersburg, Ohio—The Citizens Light & Power Co has been incorporated, with a capital stock of $35,000, to construct a light and power plant. The incorporators are G H Hillman, R. E Dreyer, W L Koch, F F Kavanaugh and C W Tolad.

Ridgeville, Ohio—The Ridgeville Light & Power Co will erect a transmission line from Ridgeville to Jewell. D D Douty, Defiance, Ohio, is interested.

Spencerville, Ohio—Bonds for $10,000 have been voted, the proceeds of which will be used for the reconstruction of the municipal electric-light plant.

Wyandotte, Mich.—Bonds for $40,000 have been voted, the proceeds of which will be used for the construction of a municipal electric-light plant and water system.

Morris, Ill.—According to press reports the Public Service Co. of Northern Illinois contemplates an expenditure of $1,000,000 for the construction of a power dam and plant on the Des Plaines River, about 10 miles from Morris. George H Lukes, Chicago, is Gen. Supt.

Wauwatosa, Wis.—L. G. Widule, County Clk., will receive bids at the Court House, Milwaukee, until July 2[illegible] for constructing a building and furnishing the equipment for the heating and power plant for the Milwaukee County Tuberculosis Sanitorium at Wauwatosa.

Nashua, Iowa—Plans are being considered by the Cedar Valley Power Co, which recently acquired the local electric-light plant, for the construction of a dam and the improvement of the plant.

Wyoming, Iowa—The Council recently granted a franchise to William G [illegible] and associates to construct and operate an electric-light plant at Wyoming.

Cottonwood, Minn.—R Cleland and F Hanson have been granted a franchise by the City Council to construct and operate an electric-light plant at Cottonwood.

Lake Benton, Minn.—J W [illegible] is interested in the installation of an electric-light plant at Lake Benton.

Slayton, Minn.—The Council has granted a franchise to Victor Klinger to construct and operate an electric-light plant in Slayton.

Kansas City, Kan.—The City is considering the proposition to issue bonds for $[illegible], the proceeds of which will be used for the construction of a municipal electric-light plant. George Little is City Clk.

Adams, Neb.—Johnson & Johnson, Consult Engrs, Falls City, are preparing plans for the construction of a municipal electric-light plant at Adams.

Crete, Neb.—Bonds for $[illegible] have been voted, the proceeds of which will be used for the installation of a municipal electric-light plant.

Baker, Mont.—A franchise has been granted to F G [illegible] to install and operate an electric-light plant at Baker.

Cabool, Mo.—The citizens recently voted to install a municipal electric-light plant.

Clarence, Mo.—Bonds for $[illegible] have been voted, the proceeds of which will be used for the construction of a municipal electric-light plant.

Palmyra, Mo.—(Official)—See item under "Water Supply and Irrigation."

Pattonsburg, Mo.—At a recent election bonds for $10,000 were voted, the proceeds of which will be used for the construction of a municipal electric-light plant.

Fort Smith, Ark.—The City Commissioners have instructed the City Electrician to prepare an estimate of the cost of constructing a municipal electric-light plant.

Mena, Ark.—The Century Engineering & Construction Co. is preparing plans for the installation of an electric-light plant in Mena.

Brenham, Tex.—J. J. Campbell and associates will extend their gas distributing system here and make other improvements to the plant.

Cisco, Tex.—The Cisco Gas & Electric Co. which has been organized here with a capital stock of $50,000 will construct an electric-light and power plant at Cisco. The incorporators are W. S. Michael, W. H. Tebbs and G. G. Ward.

Henrietta, Tex.—The Lone Star Gas Co., Fort Worth has increased its capital stock from $3,500,000 to $4,500,000 in order to provide funds for constructing a large gas compressor at Henrietta.

Marble Falls, Tex.—The proposition to issue bonds for the construction of a municipal electric-light plant and a waterworks system will soon be submitted to a vote of the taxpayers.

+Mexia, Tex.—The Mexia Water, Light & Power Co. has awarded the contract for the construction of a new power plant to CARL KAUHL. It is planned to spend about $25,000 in improvements.

Temple, Tex.—The Texas Power & Light Co. will install new machinery and make other improvements to its electric power plant at Temple. E. S. Fletcher, Temple, is Local Mgr.

Lordsburg, N. M.—The Eighty-five Mining Co. is constructing a new power plant at its mine near Lordsburg.

Monroe, Wash.—The plant, and franchise of the Monroe Water & Light Co. has been taken over by the Monroe Water Co., Seattle. Considerable improvements and extensions will be made to the plant. Sidney Marshall, Monroe, is Pres. and Gen. Mgr. of the new firm.

Santa Paula, Calif.—The State Railroad Commission has granted permission to the Ojai Power Co. to issue capital stock to the extent of $19,200 for improvements to the power plant. The proceeds are to be used for the purchase of additional electric equipment to cost $10,920, while $6200 will be expended on extensions and betterments, and $2080 used for the erection of new buildings.

BRIDGES

Buffalo, N. Y.—Plans and specifications for the bascule bridge to be constructed across the Buffalo River at Abbott Road have been completed. Francis G. Ward is Com. Pub. Wks.

+Paterson, N. J.—The Board of Chosen Freeholders of Passaic County has awarded the contract to the LOGAN CONSTRUCTION CO., 11 Broadway, New York, for constructing four highway bridges in Passaic County.

Cranford, N. J.—(Official)—Bids will be received until 2:30 p.m., July 24, by Jacob L. Bauer, County Engr., Elizabeth, N. J., for constructing a steel plate-girder bridge, 70-ft. span and 50 ft. wide, over the Rahway River at Springfield Ave., near Hampton St., Cranford.

★New Gretna, N. J.—(Official)—Bids will be received until 11.30 a.m., July 31, by the Board of Chosen Freeholders, Mount Holly, for constructing a reinforced concrete pile bridge with bascule span over Bass River at New Gretna. James Logan is County Engr.

Butler, Penn.—A viaduct, 741 ft. long, will be constructed over the tracks of the Baltimore & Ohio R.R. and the Bessemer & Lake Erie Ry. The cost will be divided among the city, the above railroads and the Butler Passenger Ry.

Forest City, Penn.—The County Commissioners plan to construct a viaduct on the new county road between Forest City, Penn., and Carbondale, Penn., over the tracks of the Erie R.R., Delaware & Hudson Co., and the New York, Ontario & Western Ry. Estimated cost, $70,000.

+Nanticoke, Penn.—(Official)—Bids were received, June 26, by F. R. Hendershot, County Controller, Wilkes-Barre, for constructing the proposed bridge between Nanticoke and West Nanticoke, over the north branch of the Susquehanna River. The contract has been awarded to the DRAVO CONTRACTING CO., Pittsburgh, Penn., at $278,500. Other bids were: D. M. Rosser Co., Kingston, Penn., $293,500; G. H. Beimard, Bloomsburg, Penn.; $289,500; Penn Bridge Co., Beaver Falls, Penn., $288,300; Whittaker & Diehl, Harrisburg, Penn., $283,847; James McLinden & Co., Anglesea, N. J., $281,835; Lathrop, Shea & Henwood, Scranton, Penn., $291,400; P. J. Carlin Construction Co., New York, N. Y., $281,500; engineer's estimate, $281,692.

Scranton, Penn.—The City Council, June 27, decided to construct the proposed Leggett's Creek Bridge. Estimated cost, $6000. J. D. Hayes is Dir. Pub. Wks. Noted July 2.

+York, Penn.—The County Commissioners, York, July 2, awarded the contract to G. A. & F. M. WAGMAN, Dallastown, Penn., for constructing a reinforced concrete bridge over Codorus Creek, at $5775.

Buckingham, Va.—(Official)—Bids will be received until noon, July 24, by G. P. Coleman, State Highway Comr., at Buckingham, for constructing a steel bridge over the Slate River, Buckingham County.

Lynchburg, Va.—The city, Amherst County, the Norfolk & Western Ry., Chesapeake & Ohio Ry. and the Southern Ry., it is reported have reached an agreement whereby a bridge will be constructed over the James River at Lynchburg.

Palmyra, Va.—(Official)—Bids will be received until noon, July 22, by G. P. Coleman, State Highway Comr., at the office of the Clerk, Palmyra, for constructing a steel bridge over Cunningham Creek.

Goldsboro, N. C.—The town is considering the construction of concrete bridges to cost about $20,000.

+Allisonia, Tenn.—The Louisville & Nashville R.R. Co. has awarded the contract to the MEACHAM CONTRACTING CO., Hopkinsville, Ky., for constructing a 60-ft. concrete bridge over its tracks near Allisonia.

+Brentwood, Tenn.—The Louisville & Nashville R.R. Co. has awarded the MEACHAM CONTRACTING CO., Hopkinsville, Ky., the contract for a 90-ft. reinforced concrete arch bridge, 75 ft. high, over its tracks near Brentwood.

+Townsend, Tenn.—The contract has been awarded by the Blount County Commissioners, Marysville, Tenn., to the LUTEN BRIDGE CO., York, Penn., for constructing a three-span reinforced concrete bridge over Little River, near Townsend, at $5000.

+Louisville, Ky.—(Official)—Bids were opened July 7 by the Board of Public Works for constructing the Ellison Ave. Bridge: GEORGE M. EADY, Louisville, $13,257 (awarded contract); Henry Bickel Co., $13,467; G. Robert Gregg, $15,409; Pierce Butler, $16,124; L. W. Hancock Co., $16,403; J. H. Cahill, $17,079. Noted July 2.

Dayton, Ohio—(Official)—Bids will be received until 10 a.m., July 18, by the County Commissioners, Dayton, for bridge work on the Boomershine Bridge. Walter H. Aszling is Secy.

Lebanon, Ohio—Bids will be received until 11 a.m., Aug. 3, by the Warren County Commissioners, Lebanon, for constructing a steel bridge at Nicholson Ford, over Todd's Fork, Washington Township. John M. Mulford is County Audr.

Marysville, Ohio—(Official)—Bids will be received until 1 p.m., July 27, by Charles A. Morelock, County Audr., Marysville, for constructing the Magnetic Springs Bridge.

Wapakoneta, Ohio—Bids will be received until 10 a.m., July 18, by F. W. Langhorst, County Audr., Wapakoneta, for constructing five bridges.

+Richmond, Ind.—(Official)—Bids were received, June 27, by the Commissioners of Wayne County for bridge repairs. Contracts have been awarded to ISAAC E. SMITH, Richmond, and the BURKE CONSTRUCTION CO., New Castle, Ind. Noted July 2.

+The contract for constructing the McGrew Bridge has been awarded to the PAN-AMERICAN BRIDGE CO., Newcastle, Ind., at $11,790.

Pekin, Ill.—(Official)—See item under Miscellaneous: Drainage District Work—Pekin, Ill.

+Boren, Wis.—The Wisconsin Highway Commission has awarded the contract to the IOWA BRIDGE CO., Des Moines, Iowa, for constructing a reinforced concrete bridge near Borea, at $5219.

+Rockville, Wis.—Klug & Smith, Mack Block, Milwaukee, Wis., have awarded the contract to PELETT & McMULLEN, Manitowoc, Wis., for a reinforced concrete highway bridge over the Sheboygan River at Rockville, town of Schleswig. The structure will be 80-ft. span. Bids were opened June 25. Noted June 18.

+Charlotte, Iowa—The Clinton County Supervisors, June 25, awarded the contract to the MARSH ENGINEERING CO., Des Moines, Iowa, for constructing a bridge at Charlotte, at $5078.

+Clinton, Iowa—The Clinton County Supervisors, June 25, awarded the contract to H. ANDERSON & SON, Maquoketa, Iowa, for bridge work, at $8266.

Dyke—Greater Winnipeg Water District, Winnipeg, Man.—Bids were received by the Commissioners of the Greater Winnipeg Water District, May 15, for constructing a dyke for the Falcon River Diversion from (A) TOMLINSON & FLEMING, Toronto, Ont., (awarded contract); (B) Siems Carey Co., St. Paul; (C) C. W. Sharp & Son, Winnipeg; (D) Janse Bros., Boomer & Hughes, Calgary; (E) W. Newman Co., Winnipeg; (F) William Scott, Winnipeg; (G) P. G. Dunn, Moose Jaw; (H) Northern Construction Co., Winnipeg; (I) C. G. Anderson, Winnipeg. The item bids were as follows:

EXPANSION OF THE ELECTRICAL INDUSTRY

The present estimates are that $1,200,000,000 per annum, or $4,000,000 per working day, will be required to meet the increasing business of the gas, electric light and traction business of the United States, says W. H. Gardiner, of Henry L. Doherty & Co., New York, according to the Journal of Commerce, who adds:

"The public regulation of public utilities and common carriers by state commissions has grown to an extent perhaps not generally realized. In 15 states there are public service commissions having full jurisdiction over all utilities. In eight other states these commissions have full jurisdiction, except as to capitalization. In eight other states they have limited jurisdiction over railroads and some city utilities. In twelve other states they have supervision of carriers and of some telephone and telegraph companies, leaving only two states—Utah and Wyoming—without as yet any established form of state regulation of public utilities and carriers.

"For thirty-odd years the most plenipotentiary commission has existed in Massachusetts.

"The fundamental duties of the plenipotentiary public service commission are threefold, the impartial supervision and regulation of the public service corporations in all matters affecting the good of their present or prospective customers, their supervision in such matters as concern the interests of investors in public utility securities, and the sound and proper guidance of public opinion, through published reports and otherwise, of the real conditions affecting public service corporations.

"As each new commission has been inaugurated, the first above mentioned consideration has usually been most prominently in mind, but as each new commission gets deeper and deeper into its work, it realizes that in hitherto unappreciated ways the ultimate interests of the public served, and of the public service corporation, are parallel, if not identical, instead of being antagonistic.

"For instance, the demand on the part of the public for additional public service, such as gas, electric light and power, traction, etc., has more than doubled in this country during the past decade, and those most intimately conversant with the business expect that it will more than double on its present volume during the coming decade. But when the public demands more service, it means that more plant and distributing lines have got to be provided to furnish that service. This means that additional capital has got to be induced to invest in the business to furnish this additional equipment.

"The deepest students of the public utility situation today recognize that probably its most important problem is that of obtaining this additional capital at as reasonable terms as possible. For the gas, electric light and traction business of the United States, the present estimates are that this additional capital required amounts to about $1,200,000,000 per annum, or $4,000,000 per working day of new capital required during the next five years; incidentally, an amount equal to or greater than the total new capital requirements of all the railroads of the United States.

"The more advanced public service commissions and other students of this situation have for some time recognized that it is vastly more important in the interest of the public that the public service corporations get this additional capital required at as reasonable interest rates as possible than that the present rates for gas or electric light or traction service be reduced to their bare bone minimum, or that the capital situation of any public utility be standardized on any particular academic par value basis. They recognize this because they have imagination enough to realize what a tremendous public calamity it would be if the public utility companies were not able, because of overdrastic public regulation, to get ay of this additional capital required to meet the growing demand for service.

"What, for instance, would it mean to this country if from now on no new building could be furnished with electric light, and no new suburb could be served with new electric railways? Such a failure would be a vastly greater public loss than any present immediate public gain by a reduction of 5, 10 or 15% in the present rates for public service. In conclusion, it is obvious that a business which during the past decade has doubled its volume or grown twice as fast as the railroad business of the country has, a business which has maintained its earnings and dividends during the recent years of general depression, and which has such prospects of additional public demands for additional public service, is not only in a healthy internal condition, but is in the peculiar condition where the interests of the public in the immediate future will be best served by the continuance of this reasonable business prosperity, enabling the public utility operators to get the necessary moneys to keep their facilities up to public demands."

Aerial Tramway—A Spanish company, incorporated at Bilboa, Spain, with Canadian headquarters in Toronto, has obtained concessions from the Niagara Falls Power Commission to construct and operate an aërial tramway across the whirlpool rapids at Niagara Falls. The span across the gorge will be 1180 ft., the longest of its kind in the world, and will be utilized for passenger traffic. The car will be suspended by six huge cables The company already operates a similar tramway at San Sebastian, Spain.

Contracts to Be Let

Bids received until July 28, 1914.

Barge Canal Improvements

STATE OF NEW YORK
OFFICE OF SUPERINTENDENT OF PUBLIC WORKS
Albany, June 29th, 1914.

NOTICE TO CONTRACTORS—

Sealed proposals will be received by the undersigned at his office in the Capitol at Albany, N. Y., until twelve o'clock noon of Tuesday, July 28th, 1914, at which place and hour they will be publicly opened and read, for improving the New York State canals pursuant to the provisions of Chapter 147 of the Laws of 1903, and of the amendments thereto, as follows:

—1—

CONTRACT NO. 119.
Erie Canal—Section 2.

For furnishing and driving a quantity of steel sheet piling, extending the concrete apron and performing all incidental work connected therewith at Movable Dam Five at Rotterdam, N. Y.

Sheets 1 and 2.

—2—

CONTRACT NO. 120.
Erie Canal—Sections 2 and 3.

Reinforcement of the superstructures of the following seven movable dams over the Mohawk River:

Dam 5 at Rotterdam, Station 1662 + 45, Erie canal.
Dam 6 at Cranesville, Station 1987 + 79, Erie canal.
Dam 7 at Amsterdam, Station 2201 + 46, Erie canal.
Dam 8 at Tribes Hill, Station 2413 + 17, Erie canal.
Dam 9 at Yosts, Station 2954 + 61, Erie canal.
Dam 10 at Canajoharie, Station 3270 + 50, Erie canal.
Dam 11 at Fort Plain, Station 3553 + 85, Erie canal.

Sheets 1 to 15 inclusive.

Plans may be seen and detailed specifications, engineer's estimate of quantities, proposal blanks, form of contract and bonds required and other information for proposers may be had at the office of the Superintendent of Public Works at Albany, N. Y., at the office of the Assistant Superintendent of Public Works for the Middle Division at Syracuse, N. Y., at the office of the Assistant Superintendent of Public Works for the Western Division at Rochester, N. Y., and at the canal office, [illegible] Exchange, Buffalo, N. Y.

Copies of [illegible] plans or drawings may be obtained from the State Engineer and Surveyor at Albany, N. Y., upon payment [illegible] of the cost of producing them.

Monthly estimates will be paid of ninety per centum (90 per cent.) of the work done at the contract price. Every proposal for said work must be accompanied by a money deposit in the form of a draft or certified check upon some good banking institution in the City of Albany or New York, issued by a [illegible] state bank [illegible] within the state and payable at sight to the Superintendent of Public Works for five per centum (5 per cent.) of the amount of the proposal.

[illegible]

Each proposal must be addressed to the Superintendent of Public Works, Albany, N. Y., and must be endorsed on the envelope with the name of the construction for which the proposal is made.

Award, if made, will be made to the person or persons whose proposal shall be lowest in cost to the State for doing the work, and which shall comply with all provisions required to render it formal. Before any award shall be made the lowest bidder will be required to satisfy the Superintendent of Public Works of his ability to provide suitable equipment and materials for the proper performance of the work.

The right is reserved to reject all proposals and readvertise and award the contract in the regular manner if, in the judgment of the undersigned, the interests of the State will be enhanced thereby.

DUNCAN W. PECK,
Superintendent of Public Works.

Bids received until Aug. 8, 1914.

Power House, etc.

NOTICE TO CONTRACTORS.—Sealed proposals for construction of Power House, including boiler plant piping and conduits, plumbing and electric work; construction, heating, plumbing and electric work for five cottages and dormitory; sewerage and sewage disposal plant and water supply works for the New York State School of Agriculture on Long Island near Farmingdale, N. Y., will be received by Dr. Franklin W. Hooper, Secretary of the Board of Trustees, 30 Lafayette Avenue, Brooklyn, N. Y., until 10 o'clock a.m. on Saturday, August 8, 1914, when they will be opened and read publicly. Bids will be received for each division of the work separately and no combination of bids will be considered. Proposals shall be submitted on the blank form and in sealed envelope addressed to the Secretary, furnished by the State Architect. This envelope shall also contain certified check in the sum of [illegible] of the amount of bid. Each contractor to whom an award is made will be required to furnish surety company bond in the sum of 50% of the amount of contract within thirty (30) days after official notice of award of contract and in accordance with the terms of specifications Nos. [illegible] The right is reserved to reject any or all bids. Drawings and specifications may be consulted and blank forms of proposal obtained at the office of Dr. Franklin W. Hooper, 30 Lafayette Avenue, Brooklyn, N. Y., at the office of Mr. A. A. Johnson, Director, Farmingdale, N. Y., and at the office of the State Architect. In applying for plans and specifications, each bidder must state which part of the work, such as construction, heating, plumbing and electric work, he intends to bid [illegible]

LEWIS F. PILCHER, State Architect.

MORE TANGIBLE THAN "SUNSHINE"

Exceedingly optimistic is a circular letter sent out by J. G. White Engineering Corporation to the heads of public service corporations. The letter says in part:

"We believe that for some time past the design and construction of many projects have been deferred because of a feeling that general business conditions did not warant proceeding actively with them.

"But it is well worth considering, particularly at this time, the more important prospects of the immediate future:

"We are apparently assured of a splendid crop return.

"It is announced that before the close of the present Congressional session the Federal legislative programme for stabilizing business will have been completed.

"It is generally conceded that currency reform was of material benefit and that its effects should promptly follow the organization period of the Federal Reserve Board.

"The possibility of war with Mexico seems daily to become more remote.

"These considerations lead obviously to the conclusion that the general outlook is decidedly favorable.

"With this in mind we believed that it would be well to secure the advantages of present market conditions and apply them to construction projects which have been under previous consideration. We are convinced that the price of materials and of labor is much lower today than can reasonably be expected when business activity is quickened.

"We believe that right now is an exceptionally opportune time to go ahead with many deferred construction projects. If the work is new development there is a distinct advantage to be gained from being prepared to supply demand as soon as it occurs, instead of later on when the market may be 'stale' or else unprofitably competitive. If the work is extension or rehabilitation there should be prompt willingness under normal business conditions to furnish added or better service."

ADVANCING PRICES

The American Steel & Wire Co. advanced prices on wire products $1 per ton July 20. Several of the Independent manufacturers have already followed with similar advances.

Cement prices are 5c. per bbl. higher in the Middle West. The new prices per barrel in bulk are as follows. Chicago, $1.17; Minneapolis, $1.40; Pittsburgh, $1.15; Duluth, $1,38; Detroit, $1.24; St. Paul, $1.40; Cleveland, $1.35.

RAILWAYS

Pennsylvania—Pennsylvania R.R.—This company plans to eliminate its tracks in West Chester, Wilkinsburg and Edgewood, Penn. A. C. Shand, Philadelphia, Penn., is Ch. Engr.

Pennsylvania—Pittsburgh & Eastern R.R.—This company, it is reported, plans to construct its proposed extension from Towanda, Penn., to Oregon Hill, Penn. The offices of the company are located at Pittsburgh.

✚Virginia—Southern Ry.—This company has awarded the contract to ROBERT RUSSELL, Danville, Va., for constructing its proposed double-track line between Danville and Dry Fork, Va. The work calls for a bridge across Dan River.

South Carolina—The Chamber of Commerce of Rock Hill, S. C., is interested in the construction of a railroad from Rock Hill to connect with the Seaboard Air Line Ry. C. W. Roberts is Secy.

Georgia—Register & Glenville R.R.—This company is having surveys made for its proposed extension to Statesboro, Ga. B. K. Willingham, Hagan, Ga., is Supt.

Georgia—Moultrie Southwestern Ry.—This company has applied for a charter to construct a line from Moultrie, Ga, southwest to the Florida state line. It will pass through Colquitt, Mitchell, Grady and Decatur Counties. W. E. Ayrock, Moultrie, is interested.

Florida—Atlantic Coast Line R.R.—This company plans to extend its Carpenter-O'Brien Branch to Fort George Island. E. B. Pleasants, Wilmington, N. C., is Ch. Engr.

Florida—Export Phosphate Ry. & Terminal Co.—This company has been organized to construct a railway 50 miles long from the plant of the Export Phosphate Co., at Mulberry, Fla., to a phosphate drying plant near Tampa, Fla.

Florida—See item under Miscellaneous: Dock and Railroad Bonds—Pensacola, Fla.

Alabama—Illinois Central R.R.—This company is having surveys made for its proposed extension from Jackson, Miss., to Birmingham, Ala., about 200 miles. A. S. Baldwin, Chicago, Ill., is Ch. Engr.

Mississippi—Illinois Central R.R.—See item under Alabama.

Kentucky—Chesapeake & Ohio Ry.—This company has filed amended articles of incorporation providing for an extension from a point in Kentucky opposite Wheelersburg, Scioto County, Ohio, through the state of Ohio for a distance of 95 miles. The general office of the company is in Richmond, Va. F. L. Cabell is Ch. Engr.

Ohio—Chesapeake & Ohio Ry.—See item under Kentucky.

Wisconsin—Chicago & Northwestern Ry.—This company, it is reported, plans to construct an extension from Kolpenick, Wis., to Pearson, Wis. E. C. Carter, Chicago, Ill., is Ch. Engr.

Montana—Chicago, Milwaukee & St. Paul Ry.—This company plans to construct an extension soon from Great Falls, Mont., through the Cœur d'Alene District. C. F. Laneth. Chicago, Ill., is Ch. Engr.

✚Montana—Great Northern Ry.—This company has awarded the contract to GUTHRIE, McDOUGALL & CO., Portland, Ore., for work at Paola, Mont., to cost $250,000.

Missouri—Surveys are being made for the proposed railroad from Springfield, Mo., to Mountain Home, Ark., about 100 miles. E. C. McAfee, Springfield, is interested.

Texas—Bartlett Western Ry.—This company plans to improve its lines. T. E. Fowler, Bartlett, Tex., is Ch. Engr.

Delta Land & Lumber Co.—This company plans to construct a railroad 15 miles long from Conroe, Tex., to its timber lands. I. H. Fetty, Kansas City, Mo., is Gen. Mgr.

Texas—A standard gage railroad will be constructed between Brownsville, Tex., and Point Isabel, Tex. The Southwestern Engineering Co., Gunter Bldg., San Antonio, Tex., is in charge of the engineering work.

Texas—San Antonio, Uvalde & Gulf R.R.—The State Railroad Commission, July 10, approved an issue by this company of $750,000 in bonds for proposed extensions. E. R. Braker, San Antonio, Tex., is Ch. Engr.

Oklahoma—Clinton, Oklahoma & Western Ry.—This company has beeen purchased by Frank Kell, Wichita Falls, Tex. It is reported that an extension will be built to Chickasha.

Arizona—Mascott & Western Ry.—This company has been incorporated for the purpose of constructing an 18-mile railroad from Wilcox, Ariz., to the mines of the Mascott Copper Co. at Dos Cabezas. The incorporators are F. N. McCauler, D. S. Stevenson, Chas. V. Weston, J. A. Street, J. C. Knapp, C. M. Stoddard and M. A. Pickett. all of whom are identified with the Mascott Copper Co.

Oregon—Sutherlin, Coos Bay & Eastern Ry.—Contracts will probably be awarded soon by this company for constructing its proposed line from Sutherlin, Ore., east to the head of Calapooia River, about 27 miles. H. D. Haley, Sutherlin, Ore., is Engr.-in-Charge.

East Oregon Lumber Co.—This company is having surveys made for its proposed railroad from Enterprise, Ore., north. J. C. Edsall, Enterprise ,is Engr.-in-Charge.

Southern Pacific Co.—This company plans to reballast its line from Portland, Ore., to Springfield Junction, Ore. Estimated cost, about $150,000. W. Hood, San Francisco, Calif., is Ch. Engr.

California—Yosemite Valley R.R.—This company, operating 78 miles of railroad, plans to repair its roadbed. G. H. Nickerson, Merced, Calif., is Ch. Engr.

California—Richmond Belt Ry.—This company has filed articles of incorporation at Martinez, Calif. The company plans to construct a line from San Pablo Wharf to Richmond, Calif. Capital, $500,000. The directors are W. S. Terrs, Clinton Warden, H. A. Wakefield, J. V. de Laveage and Horace Pillsbury.

ELECTRIC RAILWAYS

Augusta, Maine—The Lewiston, Augusta & Waterville Street Ry. Co. plans to extend its lines in Augusta. Harry B. Ivers, Portland, is Gen. Mgr. and Pur. Agt.

Worcester, Mass.—Plans are being considered by the Worcester Consolidated Street Ry. Co. for the extension of its June St. line and for relocating its tracks on Pleasant St. H. C. Page, Worcester, is Gen. Mgr.

✚Milldale, Conn.—The Waterbury & Milldale Tramway Co. has awarded a contract to CHARLES A. BIANCI, South Framingham, Mass., for the grading and track laying on the final section of five miles from Hitchcock's Lake to Milldale. John H. Cassidy, 144 Bank St. ,Waterbury, is Secy. and Gen. Mgr. William G. Smith, 51 Leavenworth St., Waterbury, is Const. Engr. Noted Aug. 7, 1913, and Feb. 5, 1914.

New York, N. Y.—The Union Ry. Co. has purchased franchises for the construction of an electric railway from City Island Station to Belden Point. The company plans to start work at once. James Carrigan, Boston Road and 176th St., is Gen. Supt.

Contracts to Be Let

Bids received until July 28, 1914.

Barge Canal Improvements

STATE OF NEW YORK
OFFICE OF SUPERINTENDENT OF PUBLIC WORKS
Albany, June 29th, 1914

NOTICE TO CONTRACTORS.—
Sealed proposals will be received by the undersigned at his office in the Capitol at Albany, N. Y., until twelve o'clock noon of Tuesday, July 28th, 1914, at which place and hour they will be publicly opened and read for improving the New York State canals pursuant to the provisions of Chapter 147 of the Laws of 1903, and of the amendments thereto, as follows:

—1—
CONTRACT NO. 119
Erie Canal—Section 2

For furnishing and driving a quantity of steel sheet piling, extending the concrete apron and performing all incidental work connected therewith at Movable Dam Five at Rotterdam, N. Y.
Sheets 1 and 2.

—2—
CONTRACT NO. 120
Erie Canal—Sections 3 and 3.

[illegible] of the superstructures of the following [illegible] over the Mohawk River:
Dam 5 at Rotterdam, Station 1663 + 15, Erie canal.
Dam 6 at Cranesville, Station 1987 + 79, Erie canal.
Dam 7 at Amsterdam, Station 2281 + 16, Erie canal.
Dam 8 at Tribes Hill, Station 2143 + 17, Erie canal.
Dam 9 at Yosts, Station 2854 + 64, Erie canal.
Dam 10 at Canajoharie, Station 3370 + 50, Erie canal.
Dam 11 at Fort Plain, Station 3573 + 85, Erie canal.
Sheets 1 to 17 inclusive.

Plans may be seen and detailed specifications, engineer's estimate of quantities, proposal blanks, form of contract and bonds required and other information for proposers may be had at the office of the Superintendent of Public Works at Albany, N. Y., at the office of the Assistant Superintendent of Public Works for the Middle Division at Syracuse, N. Y., at the office of the Assistant Superintendent of Public Works for the [illegible] Division at Rochester, N. Y., and at the canal office, [illegible] Exchange, Buffalo, N. Y.

Copies of printed plans or drawings may be obtained from the State Engineer and Surveyor at Albany, N. Y., upon payment [illegible] of the cost of producing them.

Monthly estimates will be paid of ninety per centum (90 per cent.) of the work done at the contract price. Every proposal for each work must be accompanied by a money deposit in the form of a draft or certified check upon some good banking institution in the City of Albany or New York issued by a national or State bank in good credit within the state and payable at sight to the Superintendent of Public Works for five per centum (5 per cent.) of the amount of the proposal.

[illegible]

Each proposal must be addressed to the Superintendent of Public Works, Albany, N. Y., and must be endorsed on the envelope with the name of the construction for which the proposal is made.

Award, if made, will be made to the person or persons whose proposal shall be lowest in cost to the State for doing the work, and which shall comply with all provisions required to render it formal. Before any award shall be made the lowest bidder will be required to satisfy the Superintendent of Public Works of his ability to provide suitable equipment and materials for the proper performance of the work.

The right is reserved to reject all proposals and readvertise and award the contract in the regular manner if, in the judgment of the undersigned, the interests of the State will be enhanced thereby.

DUNCAN W. PECK,
Superintendent of Public Works.

Bids received until Aug. 8, 1914.

Power House, etc.

NOTICE TO CONTRACTORS.—Sealed proposals for construction of Power House, including boiler plant piping and conduits, plumbing and electric work, construction, heating, plumbing and electric work for five cottages and dormitory, sewerage and sewage disposal plant and water supply works, for the New York State School of Agriculture on Long Island near Farmingdale, N. Y., will be received by Dr. Franklin W. Hooper, Secretary of the Board of Trustees, 39 Lafayette Avenue, Brooklyn, N. Y., until 10 o'clock a.m. on Saturday, August 8, 1914, when they will be opened and read publicly. Bids will be received for each division of the work separately and no combination of bids will be considered. Proposals shall be submitted on the blank form and in sealed envelope addressed to the Secretary, furnished by the State Architect. The envelope shall also contain certified check in the sum of 5% of the amount of bid. Each contractor to whom an award is made will be required to furnish surety company bond in the sum of 50% of the amount of contract within thirty (30) days after official notice of award of contract and in accordance with the terms of specifications Nos. 1930, 1931, 1932, 1933, 2810, 2812, 2814, 2813, 2815, 1901 and 1902. The right is reserved to reject any or all bids. Drawings and specifications may be consulted and blank forms of proposal obtained at the office of Mr. A. A. Johnson, Director, Farmingdale, N. Y., and at the office of the State Architect. In applying for plans and specifications, each bidder must state which part of the work, such as construction, heating, plumbing and electric work, he intends to bid. On and after July 14, 1914 drawings and specifications and blank forms of proposal may be obtained at the office of the State Architect upon deposit of a certified check (or cash) in the sum of ten dollars ($10.00), made payable to the State of New York, for each part of the work, which check or cash will be returned if plans and specifications are sent back in good order to the State Architect.

LEWIS F. PILCHER, State Architect.

Bids received until August 12, 1914.

Elevated Water Tank

Sealed bids will be received up to 10:00 A.M., August 12th, 1914 by the Pekin Water Works Company, Pekin, Ill., at the office of the Engineers in Chicago, for removing the present steel tank from the supporting steel tower and constructing and erecting thereon a new steel tank.

Specifications may be obtained at the office of the Engineers.

PEKIN WATER WORKS COMPANY,
W. S. [illegible], Secretary.

ALVORD & BURDICK, Engineers,
Hartford Bldg., Chicago.

Edward W. Robinson, Singer Bldg., New York, N. Y., is making a specialty of [illegible] picture [illegible] in the industrial and engineering fields and is placing on the market complete outfits at a comparatively low cost.

Construction News

★Denotes work advertised in ENGINEERING NEWS.
✚Denotes contract awarded. The names of bidders awarded contracts are set in CAPITALS.

PRICES OF ENGINEERING MATERIALS POSTPONED

The compilation of quotations on engineering materials, usually appearing in "Engineering News" in the first issue of the month, has been postponed. The rapid-changing trade and the unusual fluctuations in raw material make many quotations of small benefit. While it has not affected the iron and steel market as yet, it may possibly do so. The price of pig tin has doubled in the week, and it is almost impossible to secure supplies at any price. It is difficult to get trustworthy quotations on leather, because a great deal of the sole leather made in this country is from hides shipped from South America to Europe and then to the United States. The rubber market is likewise disorganized. It is expected that in another week some better index of mercantile conditions may be gathered and quotations published.

Construction work which has been started will be pushed to completion unless the return of low-grade labor to Europe temporarily postpones it. The subway work in New York, it is expected, will not be halted.

The combined forces of government officials and bankers have worked together to prevent any further exportation of gold and provide funds for carrying on work in this country. Fortunately, the commercial establishments of this country have been so thoroughly liquidated in the last year that there is no danger of disaster from causes within.

RAILWAYS

✚**Pennsylvania**—Pennsylvania R.R. — This company has awarded the contract to the LATTA & TERRY CONSTRUCTION CO., Philadelphia, Penn., for constructing an extension of the Sugar Camp Branch of its Tyrone Division in Pennsylvania. It will be 6½ miles long.

(Buildings continued from Page 100)

Grand Rapids, Mich.—Osgood & Osgood, Archs., Herald Bldg., Grand Rapids, have prepared plans for the erection of a six-story and basement temple for the Masonic Temple Association. The estimated cost is $[illegible],000. Noted May 21.

Oakwood, Mich.—Bids have been rejected for the school to be erected at Oakwood. New bids will be received. The estimated cost is $[illegible],000. Noted June 11.

✦Saginaw, Mich.—The general contract for the erection of the one-story and basement theatre for J. H. Kirby has been awarded to A. GELINAS & SONS, Chase Block, Saginaw, Mich. The estimated cost is $[illegible].

Chicago, Ill.—Harmat B. Norlund, 1[illegible]5 South La Salle St., will erect an 18-story office building at 101-19 South La Salle St. The estimated cost is $360,000. C. S. Frost, 105 South La Salle St., is the Arch.

Elgin, Ill.—Bids will be received until 10 a.m., Aug. 19, by the State Board of Administration, Springfield, for the erection of a building at the Elgin State Hospital. James B. Dibelka is the State Arch., 29 South La Salle St., Chicago, Ill.

Milwaukee, Wis.—Martin Tullgren & Sons, Archs., 123 Second St., are receiving bids for the erection of a three-story and basement, 28x150-ft. store and office building at Ninth and Wells Sts. The estimated cost is $50,000. Noted July 23.

H. J. Esser, Arch., Camp Bldg., is receiving bids for the masonry and concrete work for the addition to the store building of Gimbel Bros. The estimated cost is $400,000. Noted July 23.

The Milwaukee Northern Ry. Co. contemplates the erection of a terminal station at Fifth and Wells Sts. W. A. Walker is Pres.

✦Stevens Point, Wis.—Contracts for the erection of the addition to the Normal School have been awarded as follows: General contract, J. P. CULLEN CONSTRUCTION CO., Janesville, Wis., $[illegible]; heating, HARRY SOHNS, Racine, Wis., $[illegible]; tile and marble, GRANT MARBLE CO., Milwaukee, Wis., $3184. Noted July 16.

✦Waterford, Wis.—The contract for the erection of the high school at Waterford has been awarded to MATT REWALD, Burlington, Wis., at $55,000. Noted July 2.

✦Flandreau, S. D.—(Official)—The contract for the erection of the high school at Flandreau has been awarded to O. H. OLSON, Stillwater, Minn. Noted July 23.

CONTRACT PRICE

Barge Canal Work—Albany, N. Y.—Bids were received July 21 by Duncan W. Peck, Supt. of Pub. Wks., for Barge Canal Contracts, No. 109 and 118, for constructing the substructures, superstructure and approaches of the Crescent Highway bridge, Erie Canal Section 2, and constructing a highway bridge over the Mohawk River, at Amsterdam, Erie Canal, Section 3, respectively, from (A) Penn Bridge Co., Beaver Falls, Penn., (B) Frank L. Cohen, Buffalo, (C) Larkin & Sangster, Seneca Falls, (D) John W. Holler, Albany, (E) Lathrop, Shea & Henwood, Buffalo, (F) Eastover Construction Co., Inc., Gloversville, (G) Lupfer & Remick, Buffalo, (H) Walsh Construction Co., Davenport, Iowa, (I) M. Fitzgerald, Hoosick Falls, (J) Holler & Shepard, Rochester, (K) Parker & Beebe, Waterford, (L) Scott Bros., Rome, (M) John Monks & Sons, New York, (N) Oswego Construction Co., Fulton. The item bids were as follows:

Billings, Mont.—The lowest bid received for the erection of the office building for the Montana Power Co. was that of Nelson & Pederson, Butte, at $72,500. Link & Haire are the Archs. Noted Feb. 12.

El Paso, Tex.—H. M. Bentell, Jr., Arch., 404 Caples Bldg., is preparing plans for a six-story hotel at San Francisco and David Sts., for George Look and associates. The estimated cost is $[illegible],000.

Temple, Tex.—The Gulf, Colorado & Santa Fe R.R. is having plans prepared for an addition to its hospital. The estimated cost is $50,000.

Salt Lake City, Utah.—Plans have been completed for the erection of a hotel for the Newhouse Realty Co. The estimated cost is $1[illegible]0,000.

Seattle, Wash.—The Seattle Trust Co. will erect a building for a Home for the Aged and the Poor. The estimated cost is $150,000.

Seattle, Wash.—Louis Baeder, Arch., White Bldg., has prepared plans for the erection of a 7-story apartment house, for the Amos Brown Estate. The estimated cost is $200,000.

✦Walla Walla, Wash.—The Northern Pacific R.R. Co. has awarded the contract for the erection of a railroad station at Walla Walla to M. J. HURSON, Globe Bldg., Seattle, Wash., at $40,000.

Astoria, Ore.—R. F. Wassell will erect a five-story apartment house at Astoria. The estimated cost is $100,000.

Eugene, Ore.—Bids are being received by W. C. Knighton, State Arch., Salem, Ore., for the erection of an administration building at the State University. The estimated cost is $100,000.

Portland, Ore.—Camp & DuPuy, Archs., 426 East Alder St., are preparing plans for the erection of a four-story apartment building at East 13th and East Alder Sts., Portland. The estimated cost is $90,000.

Bakersfield, Calif.—Bids will be received until 10 a.m., Sept. 8, by the Board of Supervisors, for the erection of a two-story auditorium at Bakersfield. The estimated cost is $60,000.

Fresno, Calif.—George William Kelham, Arch., Sharon Bldg., San Francisco, is preparing plans for the erection of a bank building at Fresno. The estimated cost is $100,000.

Los Angeles, Calif.—Arthur G. Lindley, Arch., 412 Hollingsworth Bldg., has prepared plans for the erection of a five-story and basement hotel on Gladys Ave. The estimated cost is $100,000.

Frank Relter, 1039 Manzanita St., will erect an apartment house on Sunset Blvd. and Manzanita St. The estimated cost is $75,000.

✦Los Angeles, Calif.—The general contract for the erection of the 12-story bank and office building at Fifth and Spring Sts., for the Commercial Fireproofing Co., has been awarded to the F. O. ENGSTROM CO., Fifth and Seaton Sts. Parkinson & Bergstrom, Security Bldg., are the Archs.

Norwalk, Calif.—George B. McDougall, State Arch., Sacramento, has prepared plans for the erection of a state hospital at Norwalk. The estimated cost is $160,000.

San Diego, Calif.—The Bonita Investment Co. will erect a three-story hotel at Cape May and Abbott Sts., Ocean Beach.

Construction News

★Denotes work advertised in ENGINEERING NEWS.
✚Denotes contract awarded. The names of bidders awarded contracts are set in CAPITALS.

CHAOTIC TRADE CONDITIONS

The machinery built up through more than a hundred years practice to conduct the foreign trade of the United States has broken down, and conditions are now so unusual that trade abroad is practically impossible, at this writing, even if there were vessels to convey the merchandise. All this occurs through the breaking down of foreign exchange, and for the time being, any trading which is carried on will have to be done more or less by barter.

Such a catastrophe as a general foreign war, involving all of Europe, was scarcely dreamed of. To be plunged into it in less than a week and then have European investors unload securities acquired here for a couple of generations, would have caused immeasurable suffering in this country and the wiping out of competence and fortunes. For this reason, the closing of the principal exchanges in the United States, the resort to clearing house certificates and emergency currency was the measure of protection, not because of alarming conditions in the United States, but to prevent the general European panic from spreading here. Business activity in the United States will resume its normal status, after the lapse of a few months, but in a more restricted way, particularly if the European nations continue their conflict for any great length of time thus requiring the issue of an enormous bulk of new securities. This will raise the interest rate of the world and will make it difficult for municipalities and geographical divisions to secure money at the old rate of interest.

The Comptroller of the City of New York has announced that subway work now under construction would go forward and that the remaining contracts would be let, permitting the rounding out of the system. This is as it should be. Some other work will be postponed, such as the $12,000,000 circular court house which will be a structure of beauty. It is likely that the lavish expenditures by American railways for elaborate passenger terminals will be checked for many years, but ordinary construction will go on with very little hindrance.

The fact that the American farmers are harvesting a great crop, which they will eventually sell to the people of Europe at a higher price than in time or peace, will mean much for the agricultural and financial prosperity of the country. The crop report of Aug. 1, however, was much less satisfactory than was expected.

Prices of materials are difficult to quote. There is always hand-to-mouth buying by some consumers who must have supplies. The U. S. Steel Corporation announced on Aug. 5 that all quotations had been withdrawn on Aug. 4. This means that there is no standard price for steel products. One reason why the steel trade is unable to take contracts for forward delivery is the shortage of ferro-manganese. This material, which comes from Russian ore, for the most part, is practically indispensable in the present process of steel manufacture. Some manganese ore comes from South America, but for the present there is no way of knowing when it will be possible to secure supplies.

A spectacular advance in pig tin doubled the price in less than a week, leather is scarcely quoted, while the rubber market is demoralized. Within a month trade conditions as far as the U. S. is concerned, should settle down and become more or less normal.

Comparative Prices—The wild movement in the price of commodities is shown in the accompanying table. Some of the quotations given are of course only of academic interest to readers of the paper but they serve to show the startling changes in a few weeks .

Wholesale Prices	July 1	Aug. 10
Pig Tin per lb.	$0.31	$0.64
Solder per lb.	0.20	0.38
Antimony per lb.	0.07½	0.16
Rubber (up river) Para fine per lb.	0.60	1.20
Quicksilver per flask	35.00	85.00
Sugar 100 lb.	4.40	6.00
Flour per bbl	4.50	5.85
Corn bu. (Chicago)	0.55	0.72
Wheat bu. (Chicago)	0.77	0.98

LABOR

Most of the Labor Bureaus in New York are of the opinion that there will be no shortage of contract laborers. The general opinion is that there will be a surplus of laborers, particularly of this class, in the very near future. The mobilization of Austrians, Germans, and men of the Balkan provinces in this country, has practically ceased, owing to the inability to secure transportation; and most of these will be looking for work. There has also been a great rush of foreigners to get naturalization papers. Most of the construction work has been carried on by immigrants from the south of Italy, and the Italian immigration has made up nearly 25 per cent. of the total immigration coming into this country. In the accompanying table, taken from the immigration report for May, 1913, the United States Department of Labor, is shown the total permanent immigration. The temporary, or non-immigrant arrivals being given in a different part of the report and not published. Unofficial figures for May and June are also available, the total immigration for May numbering 107,796, while for June the number was 71,728, Italian immigration, alone, falling off about 14,000.

AN EXCITED METAL MARKET

[illegible] the New York [illegible] market [illegible] such violent [illegible] United States sales have been made below 11 cents. Lead and [illegible] but the markets are nervous.

Pig Tin—[illegible] the tin market was excited but no sales for [illegible] were made [illegible]. On the following day with the [illegible] of the London metal exchange, the New York Stock Exchange and the New York Metal Exchange [illegible] of international credit, the inability to [illegible] were more or less chaotic [illegible] Since that time markets for small lots of tin in New York have been represented by the following [illegible] Aug. 1, [illegible] Aug. 3, 50 to [illegible] Aug. 4, [illegible] Aug. 6, 61 [illegible] Aug. 7, 61 [illegible]

Most of the tin used in the United States comes from [illegible] and is shipped direct to London. From there it is shipped on the Atlantic Transport Line, the only [illegible] from London to the United States. The [illegible] in this country is [illegible] tons a week. When the [illegible] there were in the United States 13[illegible] tons of tin in [illegible]. Of course, the tinplate companies [illegible]. With the embargo on shipping and the refusal of the British government to permit the exportation of [illegible] metals, the price jumped rapidly and the [illegible] has arrived since that time in consequence [illegible] on Monday aggregating 365 tons. There is [illegible] high seas for American ports about [illegible] tons. What the tin market will do is a question. Suggestions have been made that the U. S. Steel Corporation will [illegible] of its vessels to Singapore to secure tin. [illegible] Then, too, there is a possibility that the [illegible] be [illegible] up and shipping in English and neutral bottoms be resumed on the high seas. This will [illegible] crash in the price. As far as the metal itself is concerned, it affects mostly the tin plate trade, but [illegible] other arts that its advance is [illegible] many lines not ordinarily known to be [illegible]

Copper—Approximately [illegible] of the copper produced in this country is consumed in Europe. Manufacturing has [illegible] on the continent and will in England in the near future [illegible] the price of copper has dropped to [illegible]. It is probable that a round lot could be purchased [illegible] even 12[illegible]. At present the market is represented by a quotation of 12.7[illegible], but this is [illegible]. Producers have taken steps to restrict the output and it will undoubtedly soon be adjusted to consumption. In the meantime the reports of the Copper Producers' Association will not be issued.

Lead—The market is steady and shows no change, being quoted at 3.[illegible] New York, and 3.[illegible] East St. Louis.

Spelter—The war has had no effect on the spelter market as yet, but it [illegible] will in the near future [illegible] metal to [illegible]. Prime Western sells at 4.90 to [illegible] New York and [illegible] East St. Louis.

Antimony—This metal, which is used to a limited amount in the making of anti-friction metals and in various compositions, has [illegible] advanced beyond all limits. Special [illegible] which a week ago were sold at 7[illegible], now command [illegible] per pound, and ordinary antimony is selling at 11 to [illegible]. Most of this metal comes from Germany. It is [illegible] in the manufacture of shrapnel and munitions of war.

IRON AND STEEL

[illegible]

Pig Iron—[illegible]

Steel Rails—[illegible]

Structural Materials—[illegible] angles 3 to 6 in., and tees 3 in. and over. Other quotations are on practically the same basis, subject to the usual charge for extras.

Plates—The general market is represented by a quotation of 1.1[illegible] to 1.15c. f.o.b. Pittsburgh. Chicago mill deliveries are 1.30 to 1.[illegible], and plates from store there are 1.75 to 1.[illegible]. In New York mill shipments are 1.31 to 1.3[illegible]c. The plate business should improve due to a demand for shipping.

Pipe—The market for pipe, which was one of the brightest of [illegible] in the steel market, has suddenly [illegible] and there is practically no business. The oil producers have been obliged to tie up all their cargo ships. The price of crude oil [illegible] declined, therefore there is no demand for pipe. Quotations are unchanged, but there is very little business at these figures.

Sheets—The price of sheets advanced from $1 to $2 per ton. Stocks at the mills are very [illegible] and it is believed that most of the business on the books of manufacturers will be delivered promptly. There seems to be a little improvement in the demand for galvanized sheets. No advance has been made for sheets from New York stock. The following quotations are correct for large lots from Pittsburgh and small lots from store New York and Chicago:

	Cents per pound			
	Carload lots, Pittsburgh		Small lots, Chicago	
Nos.	Black	Galv.	Black	Galv.
10 and 11	1.[illegible]	1.[illegible]	2.1[illegible]	[illegible]
12	1.[illegible]	1.[illegible]	2.[illegible]	[illegible]
13 and 14	1.6[illegible]	1.95	[illegible]	[illegible]
15 and 16	1.6[illegible]	[illegible]	[illegible]	[illegible]
17 to 21	1.[illegible]	2.2[illegible]	[illegible]	3.1[illegible]
22 and 24	1.70	2.[illegible]	[illegible]	[illegible]
25 and 26	1.7[illegible]	[illegible]	[illegible]	[illegible]
27	1.80	2.6[illegible]	[illegible]	3.[illegible]
28	1.85	[illegible]	[illegible]	3.[illegible]

Old Materials—The market is so unsettled that it is useless to quote any prices at present.

Coke—The market has not been affected [illegible] the other and furnace coke is [illegible] at $1.7[illegible] to $2 per net ton at oven for contract, most [illegible] being at the [illegible] and prompt shipments at $1.7[illegible]. For 72-hr. foundry coke $2.2[illegible] to $2.[illegible] is quoted.

Steel Shapes—Prices are unchanged from last month, but the market is very [illegible]. The quotations are from warehouse New York as follows:

	Cents per lb.
Refined iron:	
1 to 1½ in., round and square	[illegible]
1½ to 4 in. x ⅜ to [illegible] in.	[illegible]
1½ to 4 in. x ¼ to [illegible] in.	2.[illegible]
Norway bars	[illegible]
Burden's bar iron	3.15
Soft steel:	
¾ to 3 in., round and square	[illegible]
1 to 6 in. x ⅜ to 1 in.	[illegible]
1 to 6 in. x ¼ and [illegible] in.	[illegible]
Rods—⅝ and [illegible] in.	[illegible]
Bands—1½ to 6 x [illegible] to No. [illegible]	2.10
Beams and channels—3 to [illegible] in.	[illegible]
Angles:	
3 in. x ¼ in. and larger	[illegible]
3 in. x [illegible] in. and ¼ in.	[illegible]
1½ to 2½ in. x [illegible] in. and thicker	[illegible]
1½ to 2½ in. x ⅛ in.	2.[illegible]
1 to 1¼ in. x [illegible] in.	[illegible]
1 to 1¼ in. x ⅛ in.	2.1[illegible]
[illegible]	
1½ to 2½ x ¼ [illegible]	[illegible]
1½ to 2½ x [illegible]	2.1[illegible]
3 in. and larger	1.[illegible]0

Rubber—Prices have doubled in the last week and some grades are almost unobtainable. The London market is closed and the embargo of Continental ports prohibits shipping from Europe. The presence of rival fleets in the Mediterranean makes that shipments from the Far East will be suspended [illegible]. American manufacturers of rubber goods hope the Panama Canal may be used for vessels from the East bringing rubber. Prices are as follows: [illegible]

[illegible]

Portland Cement—The market has held well. Cement manufacturers feel that [illegible]

An Announcement by Walter Wood, [illegible]

COUNTRYWIDE GAIN IN BUILDING

For the first time in many months, the reports of building inspectors, relative to the contemplated building from plans filed, show a gain in all parts of the country. In the East, where the depression has been particularly marked heretofore, there is a gain of 19% in the 21 cities. Expressed in dollars, this amounts to $4737. For the first seven months of the year there was a trifling loss.

In 21 cities in the Middle West there was a gain of $1,600,000, or 7.7%, in July. For the first seven months of the year, the gain amounted to $5,769,000, or 3.8%.

The returns for seven Pacific Coast cities show an increase of $340,000, or less than 1%. The gain, slight as it is, shows a turning point, for the loss in the first seven months amounted to $4,200,000, which is about 7.3%.

An excellent gain of over one million dollars in seven Southern cities shows an increase of about 56%, while the figures for the first seven months of the year also show a gain.

RAILWAYS

New York—Carthage & Copenhagen R. R.—This company, it is reported, plans to construct an extension from Copenhagen, N. Y., to connect with the Lehigh Valley R.R., at Camden, N. Y. F. D. Barlow, Carthage, N. Y., is Gen Mgr.

North Carolina—Durham & Southern Ry.—This company plans to construct an extension from Dunn, N. C., to Mount Olive, N. C., 50 miles. J. E. Stagg, Durham, N. C., is Vice-Pres.

Georgia—Chattahoochee Valley Ry.—This company plans to construct an extension out of McCulloh, Ga. J. T. Barker, West Point, Ga., is Gen. Mgr.

Moultrie Southern Ry.—This company has been incorporated for the purpose of constructing a railroad from Moultrie, Ga., to a point near Decatur, Ga., about 85 miles. W. E. Ayrock, Moultrie, is interested. Noted July 23.

+Florida—St. Andrews Bay Ry. & Terminal Co.—This company has awarded the contract to J. M. WILLIS, St. Andrews Bay, Fla., for constructing a five-mile extension. E. L. Wood, St. Andrews Bay, is Ch. Engr.

Florida—Atlantic Coast Line R. R.—This company, it is reported, plans to construct an extension from Sehring, Fla., south to Big Cypress Swamp. E. B. Pleasants, Wilmington, N. C., is Ch. Engr.

Seaboard Air Line Ry.—This company plans to construct an extension 20 miles long from Bartow, Fla., in a southeasterly direction. W. D. Faucette, Norfolk, Va., is Ch. Engr.

Alabama—Birmingham & Southeastern Ry—This company has made financial arrangements for the construction of its proposed extension from Eclectic, Ala., to Birmingham, Ala. W. M. Blount, Union Springs, Ala., is Pres.

Louisiana—Texas & Pacific Ry.—This company, it is reported, plans to double-track its line from New Orleans, La., to Alexandria, La., 194 miles. C. H. Chamberlin, Dallas, Tex., is Ch. Engr.

Ohio—Chesapeake & Ohio Ry.—This company plans to spend $100,000 for additional tracks at its yards at Logan, Ohio. F. I. Cabell, Richmond, Va., is Ch. Engr.

Indiana—Pennsylvania Lines West of Pittsburgh—See item under Illinois.

Illinois—Pennsylvania Lines West of Pittsburgh—This company has secured the right of way for a third track between Chicago, Ill., and Logansport, Ind. Thomas Rodd, Pittsburgh, Penn., is Ch. Engr.

Illinois—La Salle Terminal Ry.—Isham Randolph & Co., Chicago, Ill., Consult. Engrs., have completed the final surveys for this company's proposed line from La Salle to Oglesby, Ill., and have turned the determinations over to the promoters of the proposition who are behind the Chicago, St. Louis & Gulf Transportation Co., which has inaugurated a large freight service on the Illinois & Michigan Canal, to Illinois and Mississippi River points. The railway project calls for a connecting belt line tapping the large cement plants in the La Salle District and other industries in the vicinity. Measures will be taken soon looking toward the construction of an interurban line connecting La Salle, Peru and Sterling, Ill., tapping a rich section of country unserved by adequate transportation. It is expected that this project will be fostered by the leading industries in the territory. The La Salle Terminal Ry. will require a number of steel structures over intersecting steam lines, including a swing-span over the Illinois River south of La Salle. The line has been located with a view to handling a large share of the traffic originating in the vicinity in addition to transfer business. Noted July 3.

Minnesota—Minneapolis, St. Paul & Sault Ste. Marie Ry.—This company is acquiring right of way for its proposed Thief River and International branch line. C. N. Falls, Minneapolis, Minn., is Ch. Engr.

+North Dakota—Northern Pacific Ry.—This company has awarded the contract to COOK CONSTRUCTION CO., Gilfallan Block, St. Paul, Minn., for grading for the proposed line south of Beach, N. D. Noted June 25.

Montana—Great Falls Western Ry.—This company has been incorporated in Montana to construct a 115-mile railroad from a point in Cascade County to a point in Powell County. C. L. Whiting, Lewistown, Mont., is interested.

Texas—Gulf, Texas & Western Ry.—The State Railroad Commission has granted the application of this company to issue $470,000 in bonds for improvements. B. B. Cain, Dallas, Tex., is Vice-Pres. and Gen. Mgr.

Texas—The State Railroad Commission, July 28, Austin, Tex., approved plans for the proposed interlocking system to be installed in connection with the terminals of the Union Terminal Co., at Dallas, Tex.

Oregon—Roach Timber Co.—This company will award the contract soon for the construction of 14¾ miles of railroad east from Sutherlin, Ore. The company's offices are located at Sutherlin.

California—Niland-Blythe R. R. Association—This association has been formed for the purpose of constructing a railroad from a point near Blythe, Calif., to Midland, Calif. A. E. Hull, Vanl Nuys Bldg., Los Angeles, Calif., is interested.

Ontario—Erie & Ontario R. R.—This company has been incorporated with a capital of $500,000, to construct a line from Port Maitland on the Toronto Hamilton & Buffalo Ry. and from Port Maitland east to Port Colborne, an additional 20 miles. Surveys are being made. J. N. Beckley, Rochester, N. Y., Pres. of the Toronto Hamilton & Buffalo Ry., is Pres. of the above company.

Finishing the Water Works at Panama—The contract for furnishing the pipe and some of the fittings required for the new water main to be laid from the south end of the Panama R. R. bridge at Gamboa, to the aeration basin on the hill above the Miraflores spillway, has been awarded to The United States Cast Iron Pipe & Foundry Co., 71 Broadway, New York, N. Y.

ELECTRIC RAILWAYS

Niagara Falls, N. Y.—[illegible] of the right-of-way has [illegible] by the Frontier Electric Ry. for the construction of an electric railway to connect Niagara Falls, Buffalo, Tonawanda and North Tonawanda. James S. Simmons, Niagara Falls, is Gen Mgr.

Camden, N. J.—The [illegible] Service Ry. Co. has applied to the City Council for permission to double-track its line on the White Horse Pike. R. E. Danforth, Newark, is Gen Mgr.

Lancaster, Penn.—According to press reports the Conestoga Traction Co., the Fair Association and the North [illegible] Co. are taking steps toward the construction of an electric railway from Lancaster to the fair grounds.

Waynesville, N. C.—The Waynesville & Canton Electric Ry. Co. will not construct its proposed 12-mile extension to connect Hazelwood and Canton, due to inability to secure financial backing. Henry T. Sharp, Asheville, is interested.

Pelham, Ga.—The Cairo, Pelham & Moultrie Ry. Co. has been recently incorporated with $[illegible] capital by J. J. Hill, and D. Farris, Pelham, and others and will construct an interurban railway from Pelham to Moultrie, about [illegible] miles.

Clearwater, Fla.—The City Council has granted a franchise to G. H. Freis, Clearwater, to construct an electric railway in Clearwater.

Charlotte, Mich.—A. B. Woods, Corunna, Mich., is reported to be interested in the construction of an electric railway from Charlotte to Albion, about 30 miles.

Bonner Springs, Kan.—The Kansas City, Kaw Valley & Western Ry. Co. will soon commence construction on the extension of its line from Bonner Springs to Lawrence. J. W. Richardson, 3[illegible] Delaware St., Leavenworth, Kan., is Gen Supt.

Casper, Wyo.—The Casper Street Ry. Co., recently incorporated with $[illegible] stock, will build an electric railway in Casper from Burlington depot to the southern boundary. James Fleming, Casper, is Pres.

Cotter, Ark.—N. V. Leiba, Mountain Home, Ark., is interested in the construction of an electric railway from Cotter, Ark., to Mansfield, Mo.

Blue Ridge, Tex.—The Greenville & Whitewright Interurban Co., which has completed the construction of an interurban electric railway between Anna and Blue Ridge, is preparing to extend the line to either Whitewright or Greenville.

Dallas, Tex.—William Doran of the Business Men's Committee of Dallas has retained Frederick A. Jones Co., Dallas, to make surveys for the proposed interurban electric railway, to be constructed between Dallas and Wichita Falls.

Palestine, Tex.—W. F. Brashier, of Corpus Christi, is preparing to construct a street railway system at Palestine. He will soon make application to the City Council for the necessary franchise for the use of certain streets.

San Antonio, Tex.—It is announced by W. B. Tuttle, Vice-Pres. of the San Antonio & Austin Traction Co., that the project of constructing an interurban electric railway between San Antonio and Austin has been temporarily abandoned due to unsatisfactory business conditions in the country, as a result of the European war.

Phoenix, Ariz.—R. W. Martin of New York and associates have purchased the franchise and other holdings of the Salt Valley Electric Co. and will construct an interurban electric railway between Phoenix and Mesa via Tempe, a distance of 18 miles. An electric power station will be built in connection with the project.

Everett, Wash.—The Everett Ry. Light & Water Co. will extend its tracks from the depot to the main part of the town. Stone & Webster, 147 Milk St., Boston, Mass., are the Mgrs.

Portland, Ore.—The Portland & Oregon City Ry. Co. has received a franchise from the City Council to construct an electric railway through the eastern section of the city to connect with the line being built from Oregon City to Portland. Noted Apr. [illegible]

Niland, Calif.—The Niland-Blythe Railroad Association has been organized for the purpose of constructing an electric railroad from Niland to Blythe. Arthur E. Hull, Los Angeles, is Pres.

Orange, Calif.—Preliminary surveys are being made by the Pacific Electric Ry. Co. for the construction of an electric railway from Orange to Brea. J. McMillan, Los Angeles, is Gen Mgr.

Redwood, Calif.—The Redwood Harbor Co. contemplates the construction of an electric railway to connect the foothills country with the waterfront.

LIGHT, HEAT AND POWER

◆Bedford Hills, N. Y.—The following bids were received July [illegible] by the Board of Managers of the New York State Reformatory for Women, for a power plant, piping and [illegible] system: [illegible] T. Ford Co., Rochester, $[illegible]; Wall Engineering & Construction Co., Inc., New York, $[illegible]; [illegible], New York, $[illegible]; the W. H. Armstrong Co., [illegible], $[illegible]; [illegible], New York, $[illegible]. [illegible]

Westfield, N. Y.—At an election held July [illegible], the citizens voted in favor of a bond issue of $[illegible] for the purpose of remodeling and extending the municipal electric-lighting system. [illegible] is Supt.

[illegible], N. J.—The Public Service Electric Co. has made an offer to the city to place all wires underground at an expenditure of $[illegible] [illegible] until the work is completed.

Bordentown, N. J.—The City Commission is considering the installation of a municipal electric lighting plant, estimated to cost about $[illegible].

Camden, N. J.—The Public Service Electric Co. has made an agreement with the city to place all of its wires underground. [illegible] [illegible]

Elizabeth, N. J.—It is reported that the Singer Mfg. Co., manufacturer of sewing machines, will build a new power station at its plant at Elizabethport.

◆Newark, N. J.—The Board of Education has awarded the contract for the installation of heating and ventilating apparatus at the North Seventh St. School to JOHN H. COONEY, Harrison, N. J., at $21,787.

South Amboy, N. J.—The Middlesex & Monmouth Light, Heat & Power Co. has applied to the Board of Chosen Freeholders of Middlesex County, New Brunswick, for permission to construct a transmission line from South Amboy to Whale Creek.

Gettysburg, Penn.—The Town Council has adopted a resolution providing for the establishment of a municipal electric-light plant. An engineer will be engaged at once to prepare plans and estimates for the plant.

Philadelphia, Penn.—The Philadelphia Electric Co. has awarded the contract for the construction of a power house on Christian St., near Schuylkill Ave., to the FIDELITY CONSTRUCTION CO. The plant will cost about $1,[illegible], and the equipment will include two turbo-generators of 30,000 and 3[illegible] hp. respectively. It will furnish power to operate the Pennsylvania R.R. from the Broad St. Station to Paoli, Penn.

Kinston, N. C.—It is reported that Gilbert C. White, Charlotte, N. C., has been engaged to supervise the reconstruction of the municipal electric-light plant.

Fort Meade, Fla.—An election will be held Aug. 21 to vote on the question of a bond issue of $2[illegible] for the purchase or construction of a municipal electric-light plant.

Mabou, Miss.—The Board of Aldermen has granted a franchise to F. H. Mudd for the establishment of an electric-light plant in Mabou. It is expected to have the plant in operation within three months.

Cave City, Ky.—The Cave City Ice Co. contemplates the installation of an electric-light plant in connection with its present equipment.

Louisville, Ky.—Bids will be received until Aug. 19, by S. D. Jones, Business Mgr. of the Board of Education, for the installation of heating and ventilating equipment in the Flat Lick School.

Cincinnati, Ohio.—(Official)—Bids will be received until noon, Sept. 1, by the New Courthouse Building Commission of Hamilton County for heating and ventilating, electrical work, elevator equipment and a power plant for the new Courthouse and County Jail. Rankin, Kellogg & Crane, 1012 Walnut St., Philadelphia, Penn., are the Archts. James A. Green is Pres. of the New Courthouse Bldg. Comn.

Cleveland, Ohio.—Bids will be received until noon, Aug. 21, by the Commissioner of Purchases and Supplies, City Hall, for the construction of the Walworth Ave. substation for the municipal electric-light system. The building will be of brick and reinforced concrete, two stories, 47x1[illegible] ft. It will cost about $30,000. F. W. Ballard is Comr. of Light and Heat.

Hamilton, Ohio.—It is reported that another unit will shortly be added to the municipal electric-light plant at a cost of about $[illegible],000. Joseph Myers is Dir. of Pub. Ser.

Mason, Ohio.—Plans have been completed for the establishment of a municipal electric-light plant, for which $14,000 in bonds have been issued.

Sycamore, Ohio.—Bids will be received until Aug. 14, by the Board of Trustees of Public Affairs, O. J. Niebel, Clk., for improvements and repairs to the municipal electric-light plant and water-works. George Champe, 610 Nasby Bldg., Toledo, is Consult. Engr.

Gary, Ind.—The City Council has granted a 25-year franchise to Sigwald Moe, C. H. Maloney and Henry A. Vosser, all of Gary, for the construction and operation of a central heating plant. The initial cost will be about $2[illegible].

◆Tell City, Ind.—The contract for rebuilding the municipal electric-light plant has been awarded to the GENERAL ELECTRIC CO., Schenectady, N. Y., at $12,[illegible]. Noted July 2.

Escanaba, Mich.—The Escanaba Traction Co. will construct a third dam and hydro-electric plant on the Escanaba River. The power house will be located just below Chandler Falls, and will generate 1[illegible] hp. F. L. Utley is Secy. and Gen. Mgr. of the Escanaba Traction Co.

Saginaw, Mich.—(Official)—The city is considering the installation of a municipal electric lighting system, estimated to cost about $[illegible]. Herman H. [illegible] is City Engr.

◆Denison, Iowa.—The City Council has awarded the contract for the construction of a building for the municipal light plant to [illegible] & [illegible], Denison, at $[illegible]; the contract for the equipment of the plant was awarded to the McGRAW ELECTRIC CO., Omaha, Neb., at $22,9[illegible]. Noted July 9 and July 23.

◆Manilla, Iowa.—The City Council has awarded the contracts for the municipal electric-light plant to the MIDWEST ELECTRIC CO., Omaha, Neb., at $11,1[illegible] for the equipment of the building, to include a [illegible]-hp. Diesel oil engine and a [illegible]-kw. dynamo. The contract for overhead equipment was awarded to the STANDARD ELECTRIC CO., Waterloo, Iowa, at $[illegible]. Noted Apr. [illegible]

◆[illegible], Minn.—The contract for improvements to the municipal electric-light plant and water-works has been awarded to [illegible] WHITAKER & CO., St. Paul. The work will include building a new tank and smokestack and installing some new equipment.

Ceylon, Minn.—The City Council has engaged Earle D. Jackson, St. Paul, to prepare plans for the construction of a municipal electric-light plant, for which [illegible] in bonds have been issued. F. H. [illegible] is City Clk.

◆Owatonna, Minn.—The State Board of Control, Minneapolis, has awarded the contract for heating, [illegible] and plumbing in the State Public School at Owatonna to the [illegible] CO., Owatonna, at $[illegible].

Virginia, Minn.—Bids will be received until 7 p.m., Aug. 17, by the Water & Light Department, for the construction of a high-pressure gas plant. J. W. Murphy is Secy. of the Water and Light Comn.

Erwin, S. D.—The city is contemplating the installation of a municipal electric-lighting system.

Parker, S. D.—Bids will be received until Aug. 25, by C. L. Jones, City Audr., for the construction of a municipal electric-light, heat and power plant. The estimated cost is $20,000. The Oscar Claussen Engineering Co., Commercial Bldg., St. Paul, Minn., is Engr.-in-Charge. Noted June 11 and July 9.

Auxvasse, Mo.—M. R. Kennedy has made application to the Public Service Commission for permission to construct and operate an electric-light plant in Auxvasse.

Linn Creek, Mo.—Plans are being prepared for the construction of a hydro-electric plant on the Niangua River, near Linn Creek. It will include five dams of 40 to 50-ft. heads between Linn Creek and Bennett's Mills, and a steel tower transmission system to distribute electricity within a radius of 100 miles. L. C. Scott is interested. Noted Jan. 22 and Mar. 5.

Bogata, Tex.—Roy Riggs, Brownwood, Tex., is interested in the organization of a company to establish an electric-light and power plant in Bogata.

Paris, Tex.—The electric power plant which the Texas Power & Light Co. will build in Paris will be equipped with three 500-hp. improved Deisel engines with a full complement of electrical machinery. A transmission line will be built by the company from Paris to Bonham.

McLoud, Okla.—(Official)—Bids will be received by the Board of Trustees until 2 p.m. Aug 17, for the construction of transmission lines and a system of street-lighting. The Benham Engineering Co., American National Bank Bldg., Oklahoma City, is Eng. in Charge. Noted June 25.

Mangum, Okla.—At a recent election, the citizens voted in favor of a bond issue of $100,000, to be used for the purchase of the electric-light, water and ice plant.

Culdesac, Idaho—The City Council has granted a franchise to W. L. Marrs, Cœur d'Alene, to construct and operate an electric-light plant to serve the town and immediate vicinity. Construction work will begin shortly.

Tolchaco, Ariz.—F. G. Baum, San Francisco, Calif., and associates will construct a dam across the Little Colorado River near this point and will erect a hydro-electric plant to provide power for operating mines and other industries. It is proposed to construct transmission lines to Globe, Hayden and Ray, more than 175 miles distant from the proposed main power plant. The dam will impound 447,500 acre ft. of water and will afford a sufficient supply to irrigate a large tract of land. Mr. Baum has filed the plans for the work in the State Land Office at Phœnix.

Tucson, Ariz.—The Federal Light & Power Co. will spend $170,000 for improvements on the Tucson Rapid Transit Co. and the Tucson Gas, Electric Light & Power Co. About $100,000 will be used for power-house extensions, $40,000 for street-railway improvements, $10,000 for gas plant and $20,000 for the extension of transmission lines for irrigation pumping.

Hemet, Calif.—The Board of City Trustees is considering the installation of a municipal power plant to furnish electricity for light and power.

Bolton, Ont.—The ratepayers have voted to take over the plant of the Light, Heat & Power Co., and will spend about $10,000 for the installation of a new hydro-electric system.

St. Catherines, Ont.—(Official)—A new hydro-electric system is now under construction for the city, to cost, when fully completed, about $116,000. All contracts for the work have been awarded. J. S. Campbell is Chn. of the Hydro-Electric Comn. Noted July 9.

St. Thomas, Ont.—The City Council has appropriated $20,000 for extensions and improvements to the municipal gas plant.

+Shoal Lake, Man.—The City Council has awarded contracts for the construction of a municipal power plant to: E. R. SNIDER, Shoal Lake, for building; CANADIAN GENERAL ELECTRIC CO., Winnipeg, Man., to furnish generator, switchboard and pole line materials and construction; the REFRIGERATION & ENGINEERING CO., Winnipeg, for a Campbell oil engine. Total cost, $21,200. Noted May 14.

Moose Jaw, Sask.—Bids will be received until noon, Aug. 26, by the City Commissioners for furnishing high pressure steam pipes and appliances for a 3500-hp. plant. James Pascoe and W. F. Heal are Comrs.

Calgary, Alta.—The Western Canada Flour Mills, Ltd., has had plans prepared by Theodore Kipp, Union Trust Bldg., Winnipeg, Man., for the construction of a power house at its plant.

BRIDGES

Ashland, Mass.—Bids will be received until Aug. 15 by Charles T. Dearborn, Chn. of the Bridge Com., for the construction of a reinforced concrete bridge on Concord St.

+Cambridge, Mass. — (Official) — The Commissioners of Middlesex County have awarded the contract for the construction of a road and concrete bridge in the towns of Medfield and Sherborn to the CHARLES J. JACOBS CO., 107 Terrace St., Roxbury, Mass., at $10,238. Other bidders were: Hyde Park Construction Co., Boston, $10,960; H. d'Ippolite & Co., Wrentham, $11,906; Hapgood Frost Co., Wellesley, $12,693; Hancock Engineering Co., $12,720; B. Perini & Co., Ashland, $12,703. Noted July 30.

★Charlotte, N. Y.—(Official)—The following bids were received Aug. 6, by the Monroe County Building Commission, Rochester, for the construction of a bridge across the Genesee River at Charlotte: Double leaf bascule bridge, (a) Strauss double leaf bascule, (b) Scherzer double leaf bascule, (c) Rall double leaf bascule; Penn Bridge Co., (a) $231,940; Lupfer & Remick, (a) $255,002, (b) $240,008, or $233,708 with cylinders on west end; Strobel Steel Construction Co., (c) $244,962; McHarg-Barton Co., (a) $248,343 with concrete fixed superstructure, or $262,975 for official plans, (c) $245,496 with concrete fixed spans, or $260,078 with steel fixed superstructure; Seneca Engineering Co., (a) $262,466; R. T. Ford Co., (a) $275,684; P. J. Carlin Construction Co., (a) $276,749. For a single leaf bascule and swing bridge, the bidders were: (a) Bobtail swing bridge, (b) Strauss single-leaf bascule, (c) Rall single-leaf bascule; Penn Bridge Co., (a) $207,023 with plank floor, or $225,023 with pavement, (b) $226,457; Strobel Steel Construction Co., (a) $235,152; R. T. Ford Co., (a) $237,335 with plank floor, or $243,705 with pavement; Lupfer & Remick, $239,008 for Scherzer single-leaf with cylinders, $260,708 for Brown single-leaf with cylinders, or $266,308 for Brown single-leaf, official plan otherwise; McHarg-Barton Co., (c) $242,996 with concrete fixed superstructure, or $257,628 with steel fixed superstructure; Seneca Engineering Co., (b) $244,950, or $269,192 for straight swing bridge. The contract will probably be awarded on Sept. 2. Noted Dec. 11 and Dec. 25, 1913, Apr. 23 and June 11, 1914.

★Norwich, N. Y.—(Official)—The Town Board has rejected all bids received Aug. 5 for the construction of a reinforced concrete bridge over Chasawacta Creek, as exceeding the appropriation. New bids will be received until 1:30 p.m. Aug. 19. C. E. Harris, Sturdevant Blk., Norwich, is Engr. Irving D. Tillman is Town Clk. Noted July 30.

Syracuse, N. Y.—Plans are being prepared for the construction of a new bridge at Oxford St., for which there is an appropriation of $11,000, and for rebuilding the West Newell St. Bridge for which $10,000 is available. Both bridges will span Onondaga Creek, and will be of the box-girder type, with one roadway and two sidewalks. W. T. Wooley is City Engr.

Troy, N. Y.—The Troy & West Troy Bridge Co. is having plans prepared for the construction of a bridge across the Hudson River. Bids will be asked about Sept. 1.

+Yonkers, N. Y.—The Board of Contract and Supply has awarded the contracts for the construction of two bridges over the Bronx River between Yonkers and the Town of Eastchester to NICHOLAS FAGNANI, Tuckahoe, at $8416 for the bridge at Front Ave., and to WILLIAM M. KNOX, New York, N. Y., at $7945 for the bridge at Palmer Ave. Both bridges will be of reinforced concrete.

Bids will be received until Sept. 8 by the Board of Contract and Supply for the erection of a reinforced concrete bridge at Dewitt Ave.

Elizabeth, N. J.—The Boards of Chosen Freeholders of Union and Hudson Counties have instructed their engineers to prepare preliminary plans and estimates of the cost of a bridge across Newark Bay, connecting Elizabethport and Bayonne, the bridge to be built jointly by the two counties. Jacob L. Bauer, Elizabeth, is County Engr. of Union County. Noted Dec. 4, 1913.

Newark, N. J.—The Board of Chosen Freeholders of Essex County has instructed Frederick A. Reimer, County Engr., to prepare plans for a bridge over the Passaic River at Elwood Ave., connecting the Woodside section with Arlington. It will be of the lift type, 60 ft. wide, and about 3000 ft. long. The estimated cost is $800,000.

New Brunswick, N. J.—Bids will be received until Aug. 24 by the Board of Chosen Freeholders of Middlesex County for the construction of a concrete slab bridge over Deep Run on the South Amboy-Bordentown Turnpike. Alvin B. Fox, Perth Amboy, is County Engr.

Trenton, N. J. — The Board of City Commissioners has approved revised plans for the construction of bridges over the canal at Greenwood and at Hamilton Aves. J. R. Fell, Jr., is City Engr.

Butler, Penn.—(Official)—Bids will be received until noon, Aug. 20, by the Commissioners of Butler County for the construction of a reinforced concrete bridge over a branch of Buffalo Creek, Clearfield Township, and for a creosoted plank and block floor in the Bonnie Brook Bridge. W. B. Scott is Clk. of Comrs.

Philadelphia, Penn.—Bids will be received until Aug. 14 by Morris L. Cooke, Dir. Dept. of Pub. Wks., for the construction of a bridge at Warrington Ave., known as the 71st St. Bridge.

+Sunbury, Penn.—The County Controller and the Commissioners of Northumberland County have awarded the contract for the construction of a steel truss bridge over Shamokin Creek at Keefer's Station to REIMARD BROS., Bloomsburg, Penn., at $5280. Other bids were: Groten Bridge Co., $5900; C. L. Remsey & Peter Barr, $6113, and Whitaker & Diehl, $6237.

★Baltimore, Md.—(Official)—Bids will be received until noon, Sept. 15, (change of date from Aug. 13) by the State Roads Commission, Garrett Bldg., for the construction of the Hanover St. Bridge. For details, see advertisement under Contracts To Be Let. Noted July 30.

(Buildings continued from page 117.)

Waterloo, Iowa—[illegible] & [illegible], Chicago, Ill., are preparing plans for a [illegible]-story [illegible] building on [illegible] and [illegible]th Sts. for Mrs. C. O. Lamson. The estimated cost is $[illegible].

Philipsburg, Mont.—J. H. Ehlers, Sayers Bldg., Spokane, will erect a [illegible] hospital at Philipsburg. The estimated cost is $[illegible].

+St. Louis, Mo.—The contract for constructing the eight-story building on [illegible] St., for the Joseph Pulitzer Estate, has been awarded to JAMES STUART & CO., at about $[illegible].

Hot Springs, Ark.—The lowest bid submitted for erecting the [illegible] Methodist Church was from J. D. [illegible], Hot Springs, at $[illegible]. John Gaisford, Memphis, Tenn., is the Arch.

Prescott, Ariz.—The Supervisors of Yavapai County plan to erect a [illegible] to cost about $250,000.

Bellingham, Wash.—The Board of Education has had plans prepared by [illegible] F. [illegible], Arch., Sunset Block, for the erection of a brick and concrete school. The estimated cost is $[illegible].

+Port Angeles, Wash.—(Official)—The contract for constructing the two-story and basement brick courthouse has been awarded to the SOUND CONSTRUCTION & ENGINEERING CO., Seattle, at $[illegible]7,688. Francis W. Grant prepared the plans. Noted July 30.

+Seattle, Wash.—The contract for constructing the 10-story hotel for the Rainier Heat & Power Co., has been awarded to DITLEFSEN & GERRING, at $160,000. Noted July 3[illegible].

The city contemplates erecting an auditorium at Seattle. The estimated cost is $250,000.

Los Angeles, Calif.—Arthur [illegible], Hollingsworth Bldg., is preparing plans for a five-story hotel at Fourth St. and Glassell Ave. The estimated cost is $100,000.

Los Angeles, Calif.—Austin & Pennell, Archs., Wright & Callender Bldg., are preparing plans for the erection of a building on Wilshire Blvd., for the Marlborough School for Girls. The estimated cost is $60,000.

Oakland, Calif.—Bids will be received until noon, Aug. 20, by the City Council for completing of the municipal auditorium, including elevators, marble and tiling, cement finish, [illegible], plastering and electrical work. Frank M. Smith is City Clerk.

[illegible]gham & Polito, Archs., First National Bank Bldg., San Francisco, Calif., have been commissioned to prepare plans for a seven-story hotel for Blake & Moffitt, to cost about $[illegible].

+San Francisco, Calif.—The Panama-Pacific International Exposition Co. has awarded a contract for the construction of a Court of the Universe on the Exposition site to STREIB-[illegible] & PETERSEN, at $[illegible].

[illegible] & Lofquist, Archs., 742 Market St., are completing plans for a three-story brick school for St. Paul's Parish, estimated to cost $[illegible].

The Board of Public Works has had plans completed for the [illegible] High School, which is to cost $165,[illegible]. Bids will be called soon for the work.

+San Francisco, Calif.—The contract for erecting the six-story brick and steel store and apartment for the [illegible] [illegible] Co., at Jones and Ellis Sts. has been awarded to G. [illegible] W. JENSEN, [illegible] Market St. at about $120,000. J. R. Miller, [illegible] Bldg., prepared the plans.

G. A. Applegarth, Arch., Call Bldg., has completed plans for a [illegible]-story apartment at Stockton and California Sts. for [illegible]. The estimated cost is $[illegible].

[illegible] & [illegible], Newhall Bldg., have completed plans for a theater at Mason and Eddy Sts. for the [illegible] [illegible] Co. The building will be six stories of reinforced concrete and is estimated to cost $[illegible].

Montreal, Que.—Plans have been prepared by [illegible] & [illegible], Archs., for the erection of a school at Montreal. The estimated cost is $[illegible].

Shawville, Que.—Bids will be received until 4 p.m. Aug. [illegible], by [illegible], Dept. of Public Works, Ottawa, Ont., for the erection of a public building at Shawville.

Toronto, Ont.—Bids will be received until Aug. 2[illegible], by W. C. [illegible], Board of Education, for the erection of the [illegible] School of Commerce.

Walkerville, Ont.—C. H. [illegible], Arch., [illegible] Bldg., is preparing plans for the erection of a theater for the [illegible] Theatre Co., 63 [illegible] St., Walkerville. The estimated cost is $[illegible].

Edmonton, Alta.—E. W. [illegible], Arch., has completed plans for the erection of a four-story office building for [illegible]. The estimated cost is $[illegible].

[illegible] will erect a [illegible]-story office building on Jasper Ave. The estimated cost is $[illegible].

Flynt Building & Construction Co., of Palmer, Mass., has established a branch office at 136 A Congress St., Portland, Maine, with Frank M. Churchill, Mem. M. S. C. E., in charge.

The Compressed Gas Manufacturers' Association, 25 Madison Avenue, New York, would like to receive from manufacturers of valves, cylinders, recording gages, filling and weighing stands and all material and appliances which enter into the manufacture, transportation and sale of compressed gases their catalogs and prices. These will be kept on file at the office of the Association.

An Arcade in New York—The Standard Oil Co., New York, has announced that plans have been accepted and adopted for an Arcade at 50 Broadway, formerly occupied by the Tower Building.

It is to be observed that this busy section of Broadway, Broad St., Trinity Place, and William St., below Cortlandt, is poorly supplied with retail shops—it has been difficult for the merchants to "break in." Recognizing these conditions the Standard Oil Co., developed plans for a building which would meet the requirements of the merchants and at the same time be one which would provide great service to the public. Several of the present buildings facing on Broadway with the rear on New St., have passages that are much used by pedestrians as the lower part of the city is poorly supplied with cross streets. H. Craig Severance and William Van Alen have been employed as the architects.

The structure will be three stories on Broadway and four stories on New St. It will be 20x70 ft. with iron and glass walls between marble pilasters. The lighting and ventilation will be from a central court.

CONTRACT PRICES

Barge Canal Work—Albany, N. Y.—Bids were received July [illegible] by Duncan W. Peck, Supt. Pub. Wks., Albany, for Contracts Nos. 119 and 120 for steel sheet piling, etc., at the movable dam at Rotterdam, N. Y., and reinforcing the superstructure of the movable dams at Rotterdam, Cranesville, Amsterdam, Tribes Hill, Yosts, Canajoharie and Fort Plain, N. Y. from (A) Frank M. Skene, Brockport, N. Y.; (B) Lupfer & Remick, Buffalo, N. Y.; (C) Walsh Construction Co., Davenport, Iowa; (D) John M. Rogers, Tonawanda, N. Y.; (E) Holler & Shepard, Rochester, N. Y.; (F) Penn Bridge Co., Beaver Falls, Penn.; (G) Whitehead & Kales Iron Works, Detroit, Mich.; (H) Fort Bridge Works, 45 Broadway, New York, N. Y. The item bids were as follows:

★**West Haverstraw, N. Y.**—(Official)—Bids will be received until 4 p.m., Sept. 5, by George Blagden, Pres. of the Board of Managers, New York State Hospital for Crippled and Deformed Children, for heating, plumbing and electric work for Solaria at the hospital. For further details, see advertisement under "Contracts To Be Let."

✚**Paterson, N. J.**—The Society of Useful Manufactures has awarded the contract for the construction of a steam turbine

power plant at the Paterson Falls basin to the JOHN W. FERGUSON CO., at $[illegible]. Noted July 2[illegible].

Cumberland, Md.—The City Council contemplates the purchase of a [illegible] generator for the municipal electric light plant. Joseph S. [illegible] is Water & Light Comr.

Wheeling, W. Va.—The Wheeling Traction Co. has taken out a permit for the construction of a new power plant on Water St. It will cost about $[illegible].

Charlotte, N. C.—Press reports state that the Southern Power Co. has secured options on a site to be used for the establishment of a steam turbine plant, to cost approximately $[illegible]. C. I. [illegible], Charlotte, is Engr.

Westminster, S. C.—Preliminary plans have been prepared by the J. B. McCrary Co., Atlanta, Ga., for the construction of a municipal electric lighting system, to be operated by steam power. An election will soon be held to vote on the question of a bond issue of $15,000 for the installation of the plant. H. H. [illegible] is Mayor.

Clarkesville, Ga.—It is reported that the town has secured a water power site about four miles away for the establishment of an electric light plant. Tentative plans have been prepared which include the erection of a steam plant for use during the building of the dam, and later in emergencies. W. T. Proctor and W. R. Polk, Elec. Engrs., Atlanta, are Engrs. in Charge.

Frostproof, Fla.—C. W. Brown and associates, Frostproof, are interested in the organization of a stock company to establish a hydro-electric plant to furnish light and power in the town.

Bay Minette, Ala.—The citizens have voted in favor of a bond issue of $[illegible], the proceeds of which will be used for the installation of a municipal electric light plant. Edgar B. Kay, Tuscaloosa, is Consult. Engr. Noted June 25.

Bowling Green, Ohio—The Board of Trustees of the Bowling Green State Normal College has approved plans for the construction of a power plant for the college.

Chillicothe, Ohio—The American Gas & Electric Co., New York, N. Y., has absorbed the Chillicothe Street R.R., Light & Power Co. It is reported that the local plant will be modernized.

Huntington, Ind.—The City Council has engaged Charles Brossmann, Union Trust Bldg., Indianapolis, Ind., to prepare plans and supervise the reconstruction of the municipal electric light plant, for which an issue of bonds was recently voted. Noted Apr. 16.

Muncie, Ind.—The Indiana Steel & Wire Co. will install another boiler unit in its plant, consisting either of two 2[illegible]-hp., two 300-hp., one 500-hp. or one 600-hp. single-unit water-tube boiler, to be equipped with stokers.

Elmwood, Ill.—Press reports state that the City Council has decided to install a municipal electric light plant, and will soon ask bids for its construction.

Superior, Wis.—The Superior Water, Light & Power Co. will issue $250,000 of additional stock for the purpose of making improvements and additions to its plant. W. H. Winslow is Gen. Mgr.

Sergeant Bluff, Iowa—Plans are being prepared for the installation of a municipal electric light plant. The estimated cost is $10,000.

Bigelow, Minn.—All bids received for the construction of a transmission and distribution system for the city have been rejected. Earle D. Jackson, Capital Bank Bldg., St. Paul, Minn., is Consult. Engr.

Adams, Neb.—It is reported that bids will be asked in about six weeks for the construction of the municipal electric light plant, a bond issue of $13,[illegible]00 having been voted for this purpose. The equipment will include two generators operated by oil engines, a two-panel switchboard, six transformers and material for four miles of overhead distribution lines. Johnson & Johnson, Falls City, Neb., are Engrs.-in-Charge. Noted July 16 and Aug. 6.

Havre, Mont.—The Havre Electric Co. is considering extensions and improvements to its plant to cost about $[illegible]0,000. F. W. McCarthy is Mgr.

Gladstone, Mo.—Plans are being prepared by Tuttle & Pike, Shubert Theater Bldg., Kansas City, Mo., for the construction of a transmission line from Gladstone to Armstrong, Mo. Bids will be asked in the near future.

Montrose, Mo.—E. T. Archer, New England Bldg., Kansas City, Mo., has been engaged by the City Council to supervise the construction of the municipal electric light plant, for which a bond issue of $6[illegible]00 was recently voted. Noted Aug. 6.

San Antonio, Tex.—Bids will be received until Aug. 24 by George W. West for the construction of an electric light plant and water-works system in George West, Tex. The estimated cost is $24,[illegible]. Bartlett & Ranney, 108 East Crockett St., San Antonio, are Engrs. in Charge.

Salmon, Idaho—The Salmon River Light, Heat & Power Co. has been incorporated at Salmon and will build a hydro-electric plant near this point. Contracts for the construction of the plant will be awarded as soon as plans are completed. C. L. [illegible] is Pres. and E. [illegible] is Gen. Mgr. of the company.

Salt Lake City, Utah—The city has granted a franchise to the [illegible] Power Co., which was organized for the purpose of constructing a central heating system for the district [illegible] by [illegible] Temple, Fifth South, [illegible] East and First West Sts. The franchise stipulates that the proposed system must be completed within three years.

Steilacoom, Wash.—Bids will soon be received by the Town Clerk for furnishing materials and [illegible] for the construction of a transmission line from the city limits of Tacoma to Steilacoom. [illegible] is Town Clk.

Hood River, Ore.—[illegible] and associates, of Hood River, have made application to the State Water Board for permission to build a hydro-electric plant on the Hood River near the town of Hood River.
